5 Tutorials 50

5.1	DatabaseSpy QuickStart Tutorial	51
5.1.1	Connecting to a Database.....	51
	<i>Opening an Existing Database Project.....</i>	51
	<i>Connecting to a Data Source.....</i>	53
5.1.2	Browsing the Database.....	53
	<i>Displaying Tables in the Online Browser.....</i>	54
	<i>Retrieving Data from Tables.....</i>	55
5.1.3	Viewing the Database Structure.....	55
	<i>Showing Tables in the Design Editor.....</i>	56
5.1.4	Querying the Database.....	57
	<i>Executing an SQL Script.....</i>	58
	<i>Creating a View.....</i>	59
	<i>Retrieving Data from a View.....</i>	60
5.1.5	Updating Database Data.....	61
	<i>Selecting a Table for Editing.....</i>	62
	<i>Executing for Data Editing.....</i>	63
	<i>Updating Table Content.....</i>	64
	<i>Adding Table Rows.....</i>	65
	<i>Deleting Table Rows.....</i>	66
5.1.6	Importing Data.....	66
	<i>Generating an Import Script.....</i>	67
5.1.7	Exporting Data.....	68
	<i>Exporting to XML.....</i>	69
5.2	DatabaseSpy Tutorial	72
5.2.1	Setting Up a Database Project.....	73
	<i>Creating a Database.....</i>	73
	<i>Connecting to the Database.....</i>	74
	<i>Adding SQL Files.....</i>	77
	<i>Renaming and Saving the Project.....</i>	78
	<i>Defining the Project Startup Options.....</i>	78
5.2.2	Adding Tables to the Database.....	79
	<i>Opening and Executing an SQL File.....</i>	80
	<i>Adding Tables Using Design Editor.....</i>	81
	<i>Generating and Editing a CREATE Statement.....</i>	86
	<i>Creating Relationships Between the Tables.....</i>	86
5.2.3	Defining Constraints.....	88

	<i>Defining a Unique Key</i>	89
	<i>Defining a Check Constraint</i>	90
	<i>Defining a Default Constraint</i>	91
5.2.4	Inserting Data into the Database.....	92
	<i>Using a Script to Add Data to the Database</i>	94
	<i>Importing Data from TXT Files</i>	95
	<i>Importing Data from XML Files</i>	97
	<i>Creating and Saving an INSERT Script</i>	100
	<i>Adding Data in the Result Window</i>	103
5.2.5	Browsing the Database.....	105
	<i>Customizing the Online Browser</i>	106
	<i>Showing the Row Count</i>	106
	<i>Filtering Objects</i>	107
	<i>Locating Database Objects</i>	108
5.2.6	Querying the Database.....	109
	<i>Using a Script to Query the Database</i>	110
	<i>Using Drag and Drop to Create Queries</i>	111
5.2.7	Using Autocompletion.....	113
	<i>Adding a New Column to a Table</i>	113
5.2.8	Updating Database Data.....	114
	<i>Editing Records in the Result Window</i>	115
	<i>Deleting a Table Row in the Result Window</i>	117
	<i>Copying Table Rows</i>	117
5.2.9	Designating Database Objects as Favorites.....	118
	<i>Adding Objects to the Favorites Folder</i>	118
5.2.10	Exporting Database Data.....	120
	<i>Exporting Tables to XML</i>	120
5.2.11	Comparing Database Schemas.....	122
	<i>Adding a Schema</i>	123
	<i>Setting Up a Database Schema Comparison</i>	124
	<i>Mapping Items</i>	126
	<i>Starting a Comparison</i>	128
	<i>Examining the Differences</i>	131
	<i>Merging Schemas</i>	131
5.2.12	Comparing Database Data.....	135
	<i>Setting Up a Database Data Comparison</i>	137
	<i>Starting a Comparison</i>	139
	<i>Showing the Results</i>	140
	<i>Unmapping and Removing Tables</i>	143
	<i>Merging Tables</i>	145

6	DatabaseSpy Projects	150
6.1	Altova Global Resources	152
6.1.1	Defining Global Resources	152
	<i>Files</i>	154
	<i>Folders</i>	155
	<i>Databases</i>	155
	<i>Copying Configurations</i>	158
6.1.2	Using Global Resources.....	158
	<i>Global SQL Statements</i>	158
	<i>Data Sources in DatabaseSpy Projects</i>	159
	<i>Changing Configurations</i>	161
6.2	Connecting to a Database	162
6.2.1	Using the Connection Wizard.....	162
	<i>How to Connect to Access</i>	163
	<i>How to Connect to SQLServer</i>	163
	<i>How to Connect to Oracle</i>	164
	<i>How to Connect to MySQL</i>	165
	<i>How to Connect to DB2</i>	166
	<i>How to Connect to Sybase</i>	167
	<i>How to Connect to PostgreSQL</i>	168
6.2.2	Creating an ADO Connection	169
	<i>Connecting to an Access Database</i>	173
6.2.3	Creating an ODBC Connection.....	175
	<i>Creating a DSN (Data Source Name)</i>	177
	<i>Building a Connection String for ODBC</i>	179
6.2.4	Creating a JDBC Connection.....	181
6.2.5	Selecting a Global Resource	184
6.3	Adding Data Sources	185
6.4	Adding Files	187
6.5	Favorites	189
6.6	Renaming and Deleting Objects	192
6.7	Properties	194
6.7.1	Project Properties.....	196
6.7.2	SQL Properties.....	198
6.7.3	Design Properties.....	200
6.7.4	Comparison Properties.....	202

7	Browsing Data Sources	206
7.1	Expanding and Collapsing Elements	209
7.2	Counting Data Rows	210
7.3	Customizing the Browser Layout	211
7.4	Selecting the Root Object	214
7.5	Displaying the Design of an Element	215
7.6	Locating Objects	216
7.6.1	Applying Filters.....	216
7.6.2	Using the Object Locator.....	217
7.7	Hiding Unselected Items	219
8	Designing Databases	222
8.1	Adding Tables	224
8.2	Selecting Tables	225
8.3	Opening, Saving, and Printing Design Files	226
9	Retrieving and Editing Data	232
9.1	Viewing Results	236
9.2	Viewing Large Data Cells	239
9.3	Searching and Sorting	241
9.4	Printing Results	243
9.5	Updating Data	244
9.6	Editing XML Columns	247
9.7	Editing Binary Columns	248
9.8	Inserting Data	250
9.9	Adding and Copying Rows	251
9.10	Deleting Data	254
10	Displaying Charts	258
10.1	Defining the Chart Type	260
10.2	Changing the Appearance of a Chart	265
10.2.1	General	265
10.2.2	Type-related Features.....	267
10.2.3	Colors	270

10.2.4	X-Axis	271
10.2.5	Y-Axis	273
10.2.6	Z-Axis	274
10.2.7	3d Angles	274
10.2.8	Sizes	275
10.2.9	Fonts	276
10.3	Choosing the Chart Data	278
10.4	Chart Overlays	281
10.5	Exporting Charts	283
10.6	Reloading the Source Data	284

11 Working with SQL 286

11.1	Generating SQL Statements	289
11.2	Opening, Saving, and Closing SQL Files	293
11.3	Formatting SQL	296
11.4	Displaying Options	300
11.5	Executing SQL	305
11.6	Autocompletion	308
11.7	Commenting Out Text	311
11.8	Naming Result Tabs	313
11.9	Finding and Replacing Text	315
11.10	Selecting Data for Export	318
11.11	Toolbar Options	320
11.12	Printing SQL	321

12 Comparing Database Data 324

12.1	Prerequisites	326
12.2	Opening a Database Data Comparison Window	328
12.3	Selecting Tables	329
12.4	Adding and Removing Tables	332
12.5	Mapping Tables and Columns	333
12.5.1	Mapping Columns.....	334
12.5.2	Changing and Deleting Mappings.....	335
12.5.3	Sorting Mapped Tables.....	336
12.6	Modifying the Database Comparison Options	338
12.6.1	Options for String Comparison.....	338
12.6.2	Options for Comparing XML Fields.....	339

12.7	Saving Database Data Comparison Files	342
12.8	Running a Database Data Comparison	343
12.9	Displaying Differences in Databases	345
12.9.1	Configuring the Comparison Result View	346
12.9.2	Navigating Differences	347
12.10	Comparing Structure from within a Data Comparison	348
12.11	Editing Compared Tables	349
12.12	Merging Database Data	350
12.12.1	Merging Tables	350
12.12.2	Displaying the Merge Script	352
12.12.3	Merging Individual Results	353
12.12.4	Reverting a Merge	355

13 Comparing Database Schemas 358

13.1	Prerequisites	360
13.2	Opening a Database Schema Comparison Window	361
13.3	Selecting Schemas	362
13.4	Adding and Removing Tables	365
13.5	Saving Database Schema Comparison Files	366
13.6	Running a Database Schema Comparison	367
13.7	Displaying Differences in Database Schemas	369
13.8	Comparing Data from within a Schema Comparison	371
13.9	Changing and Deleting Mappings	372
13.10	Merging Database Schemas	373

14 Validating XML Data 376

14.1	Assigning XML Schemas	378
14.2	Managing XML Schemas	380
14.3	Adding XML Schemas	383
14.4	Modifying XML Schemas	385
14.5	Deleting XML Schemas	386

15 Importing Database Data 390

15.1	Defining XML Import Options	393
15.2	Defining CSV Import Options	394

16 Exporting Database Data 396

16.1	Selecting Database Data for Export	397
16.2	Defining XML and XML Structure Export Options	401
16.3	Defining CSV Export Options	403
16.4	Defining HTML Export Options	404
16.5	Defining Excel Export Options	405

17 DatabaseSpy Settings 408

17.1	General Options	409
17.1.1	Online Browser.....	410
17.1.2	Change Script.....	411
17.1.3	File Types	412
17.1.4	Encoding	413
17.2	SQL Editor Options	414
17.2.1	Generation	414
17.2.2	Formatting	416
17.2.3	Autocompletion.....	417
17.2.4	Autoinsertion.....	417
17.2.5	Result View.....	419
17.2.6	Fonts	419
17.3	Design Editor Options	421
17.3.1	Element Colors.....	422
17.3.2	Fonts	422
17.4	Data Compare Options	424
17.4.1	Comparison Options.....	425
17.4.2	XML Compare.....	426
17.4.3	Result View.....	427

18 User Reference 430

18.1	Tables	430
18.1.1	Creating Tables	430
18.1.2	Duplicating Tables.....	431
18.1.3	Modifying Column Properties.....	432
18.1.4	Designing Tables.....	432
	<i>Adding Columns</i>	434
	<i>Deleting Columns</i>	435

	<i>Defining a Primary Key</i>	435

Chapter 1

Welcome to DatabaseSpy 2012

1 Welcome to DatabaseSpy 2012

Altova® DatabaseSpy® 2012 Enterprise Edition is a database client application with a consistent, elegant, and easy-to-use interface that simplifies querying, visualizing, managing, comparing, designing, and constructing relational databases. It allows database administrators, database developers, and other database-oriented IT professionals seamless access to all the databases in their organization and is uniquely beneficial when you need to interact with multiple databases created at different times by different developers. DatabaseSpy is available in 64-bit and 32-bit versions.

Copyright © 1998–2012, Altova GmbH. All rights reserved. Use of this software is governed by and subject to an Altova software license agreement. XMLSpy, MapForce, StyleVision, SemanticWorks, SchemaAgent, UModel, DatabaseSpy, DiffDog, Authentic, AltovaXML, MissionKit, and ALTOVA as well as their logos are trademarks and/or registered trademarks of Altova GmbH.

Chapter 2

What's New in DatabaseSpy Version 2012

2 What's New in DatabaseSpy Version 2012

DatabaseSpy Version 2012 R2 contains the following bug fixes and enhancements.

- Support for [PL/SQL Packages](#) and Package Bodies

DatabaseSpy Version 2012

New features in DatabaseSpy Version 2012 include:

- Support for [JDBC connections to databases](#)

2.1 Version 2011

DatabaseSpy Version 2011 contains the following bug fixes and enhancements.

DatabaseSpy Version 2011 Release 2

New features in DatabaseSpy Version 2011 Release 2 include:

- Displaying [area charts](#)
- Displaying [stacked bar charts](#)
- Displaying [candlestick charts](#)
- [Chart overlays](#)
- Bug fixes and enhancements

DatabaseSpy Version 2011

New features in DatabaseSpy Version 2011 include:

- [Displaying charts](#) from the Result window
- Fast database retrieval

2.2 Version 2010

DatabaseSpy Version 2010 Release 3 SP1

DatabaseSpy Version 2010 Release 3 SP1 contains bug fixes and enhancements.

DatabaseSpy Version 2010 Release 3

New features in DatabaseSpy Version 2010 Release 3 include:

- Enhancements in the data source connection dialog boxes
- [Loading and saving of binary data](#)

DatabaseSpy Version 2010 Release 2

New features in DatabaseSpy Version 2010 Release 2 include:

- 64-bit version of DatabaseSpy available
The 64-bit version allows users to retrieve extremely large datasets or to compare contents of very large database tables.
- Support for IBM DB2 for i 6.1
- Option to use [pure ODBC API](#) instead of native support

DatabaseSpy Version 2010

New features in DatabaseSpy Version 2010 include:

- [Statistical information](#) in the result grid
- [Comparison of database schemas](#)
- [Printing](#) data from the Result window
- [Converting a table structure](#) to comply with a different database type
- Support of Windows 7

2.3 Version 2009

DatabaseSpy Version 2009 SP1

New features in DatabaseSpy Version 2009 SP1 include:

- Support of Windows Server 2008 operating system
- [Automatic generation of primary keys](#) for new tables
- Creating columns and keys in Design Editor [using drag & drop](#)
- [Adding newly saved files](#) to project automatically
- [Toggling side and bottom windows](#) on and off

DatabaseSpy Version 2009

New features in DatabaseSpy Version 2009 include:

- [Comparison](#) of database data
- Import of [XML data](#)
- Copying cells from the result grid [with corresponding column names](#)
- [Removing whitespace, line feed, and comments](#) from SQL statements
- Enhanced handling of [folder properties](#)
- Support for SQL Server 2008, Oracle 11g, and PostgreSQL 8
- Full XML support for SQL Server 2005 and 2008
- Limited XML support for Oracle 9, 10g, and 11g as well as PostgreSQL 8.3
- [Asynchronous execution and retrieval](#)
- Optimized [Text View options](#) for seamless integration with other Altova products
- SQL [formatting configurations](#)
- [Row count](#) for database objects in the Properties window
- Enhanced look and feel of toolbar icons and menu commands

2.4 Version 2008

DatabaseSpy Version 2008 Release 2 SP1

DatabaseSpy Version 2008 Release 2 SP1 contains bug fixes and enhancements.

DatabaseSpy Version 2008 Release 2

New features in DatabaseSpy Version 2008 Release 2 include:

- Support for Altova [Global Resources](#)
- [Formatting of SQL code](#) in SQL Editor and Database Structure Change Script
- [Execution target bar](#) in SQL Editor and Design Editor
- Enhanced [Autocompletion](#)
- Support for [autoincrement columns](#) and [default constraints](#)
- Support for [triggers](#) and [functions](#)
- Automatic [expansion of star expressions](#) in SELECT statements
- [Automatic insertion and deletion](#) of closing characters, semicolons, and quotations in SQL Editor
- Showing [groupings for execution](#)
- [Pinning of results](#) in the Results window
- [Color scheme](#) for viewing relations

Chapter 3

Introduction

3 Introduction

This User Manual contains tutorials and explanations of the various DatabaseSpy features to help you get started. It also contains a comprehensive reference section that describes DatabaseSpy features in detail. The User Manual consists of the following sections:

- An Introduction, which lists [system requirements](#) and the [supported databases](#).
- A description of the of the [DatabaseSpy interface](#)
- A **Tutorial** section that shows you how to quickly get started with DatabaseSpy and makes you familiar with DatabaseSpy's features.
- A description of how to use [projects](#) to organize important elements of your database projects such as [Global Resources](#), [database connections](#), SQL files, and database design files.
- A detailed description of the **Online Browser** as well as how to [browse data sources](#) and [locate database objects](#).
- A description of the **Design Editor** which can be used to graphically maintain the structure and properties of your databases.
- A description of how to [retrieve](#) and [edit](#) data using the **SQL Editor**.
- A description of how to [display retrieved data in charts](#).
- Descriptions of how you can [work with SQL scripts](#) in the SQL Editor.
- A description of how to [compare data in database tables](#) and merge the content of two compared tables as well as how to [compare the structure of database schemas](#)
- A description of how to [maintain XML data](#) in DatabaseSpy.
- A description of how to [import data](#) from XML and CSV files into your databases.
- A description of how to [export data](#) from your databases to files of the formats XML, XML Structure, CSV, HTML, and Excel.
- A detailed descriptions of the various [options](#) you can set in DatabaseSpy.
- A **User Reference** that contains a description of database objects and how they are created in DatabaseSpy as well as a description of all [menu commands](#) available in DatabaseSpy.

File Paths in Windows XP, Windows Vista, and Windows 7

File paths given in this documentation will not be the same for all operating systems. You should note the following correspondences:

- *(My) Documents folder:* The My Documents folder of Windows XP is the Documents folder of Windows Vista and Windows 7. It is located by default at the following respective locations. Example files are usually located in a sub-folder of the (My) Documents folder.

Windows XP	C: /Documents and Settings/<username>/My Documents
Windows Vista, Windows 7	C: /Users/<username>/Documents

- *Application folder:* The Application folder is the folder where your Altova application is located. The path to the Application folder is, by default, the following.

Windows XP	C: /Program Files/Altova
Windows Vista, Windows 7	C: /Program Files/Altova
32-bit Version on 64-bit OS	C: /Program Files (x86) /Altova

3.1 OS and Memory Requirements

This section contains useful background information on the technical aspects of your software.

Operating System

This software application is a 32-bit Windows application that runs on Windows XP, Windows Server 2003 and 2008, as well as Windows Vista and Windows 7. As of Version 2010 Release 2, also a 64-bit version of the software is available.

Memory

Since the software is written in C++ it does not require the overhead of a Java Runtime Environment and typically requires less memory than comparable Java-based applications. However, each document is loaded fully into memory so as to parse it completely and to improve viewing and editing speed. The memory requirement increases with the size of the document.

Memory requirements are also influenced by the unlimited Undo history. When repeatedly cutting and pasting large selections in large documents, available memory can rapidly be depleted.

3.2 Supported Databases in DatabaseSpy

DatabaseSpy currently supports querying and editing of the following database types:

- Microsoft SQL Server 2000, 2005, and 2008
- Microsoft Access 2003 and 2007
- MySQL 4.x and 5.x
- Oracle 9i, 10g, and 11g
- IBM DB2 8.x and 9
- IBM DB2 for i 5.4 and 6.1
- Sybase 12
- PostgreSQL 8.0, 8.1, 8.2, and 8.3

Altova DatabaseSpy fully supports databases listed above. While Altova endeavors to support other ODBC/ADO databases, successful connection and data processing have only been tested with the listed databases.

When installing the **64-bit** version of DatabaseSpy, please make sure that you have access to the 64-bit database drivers needed for the specific database you are connecting to.

In addition, DatabaseSpy provides basic support for virtually any database when connected via ODBC. This includes databases such as SQLite, Mimer SQL, as well as connections to Microsoft Excel work sheets and text files. Note, however, that DatabaseSpy's functionality is limited when connected to a database that is not natively supported.

Chapter 4

The DatabaseSpy Interface

4 The DatabaseSpy Interface

When you open DatabaseSpy for the first time, the DatabaseSpy interface will show two vertical areas: on the left side, the [Project window](#) and the [Properties window](#) are displayed and tabs for the [Online Browser](#) and the [Overview window](#) are visible. These windows as well as the [Data Inspector window](#), which can be displayed on demand, are referred to as the **side windows**.

In the lower part of the right side, the [Output window](#) and the [Charts window](#) are displayed, whereas the upper part is still unused (*screenshot above*). This space will later be occupied by the **editor and comparison windows** (SQL Editor, Design Editor, or the Data or Schema Comparison windows, respectively). Except for the SQL Editor, an active connection to a data source is required to display these windows (*screenshot below*).

The different windows can be disabled or enabled via the **View** menu and, in addition, you can change the appearance of an individual window by selecting the little arrow in the title bar of a window and choosing the desired option from the drop-down list.

Hiding Side windows, Output and Change Script windows

The **View** menu also contains two options, **Toggle All Side Windows** and **Toggle Output and Change Script Windows**, that can be used to quickly hide these windows if you need all the available space for displaying the content in the SQL Editor, Design Editor, Data Comparison, or Schema Comparison window.

4.1 Side Windows

4.1.1 Project Window

The Project window displays all data source connections as well as any SQL files, design documents, or saved data and schema comparisons that you add to your project. In addition, project favorites are shown which allow you to access items that you need frequently even faster.

Project toolbar

Create a new project: Clicking this button closes the active project in the Project window and displays a new, empty project. If a project contains unsaved changes when you click this button, a dialog box appears and you can choose to save changes in the editor or comparison windows and project modifications. All editor and comparison windows are set offline.

Open a project: Shows the **Open Project** dialog box where you can choose a *.qprj file to open in DatabaseSpy. If there is an unsaved project already open in the Project window, you are prompted to save this project.

Save project: Saves the project under its project name. If you save a new project for the first time, the **Save As** dialog box is displayed where you can specify a project name and choose a location. The project name then also appears in the Project window.

Add files to the project: Shows the **Open** dialog box where you can browse for DatabaseSpy documents (SQL files, design files, data comparison files, or schema comparison files) that should be added to the project. Files are added to the corresponding folder in the Project window.

Add the active file: Adds the active file to the project. If the file has not been saved yet, you are prompted to enter a name and location for the file. The file is then added to the corresponding folder in the Project window.

Context menu options

Depending on where you right-click into the Project window, different options are displayed in the context menu. The corresponding Toolbar icons are shown to the left, and keyboard shortcuts to the right of the options if they are available.

New Project **Ctrl+Shift+N** Creates a new project.

 Project Name

Open Project **Ctrl+Shift+O** Opens a project.

 Project Name

	Save Project	Ctrl+S	Saves the project under its current name.	 Project Name
	Save Project As...		Opens the Save As dialog box where you can define a new name and/or path for the project.	 Project Name
	Add Files to Project...		Opens the Open dialog box where you can select files to be added to the project.	 Project Name  SQL  Design  Data Diff  Schema Diff
	Add Active File to Project		Includes the active file with the project and adds it to its corresponding folder in the Project window.	 Project Name  SQL  Design  Data Diff  Schema Diff
	Connect to all Data Sources		Connects to all data sources that are included in the project.	 Data Sources
	Disconnect from all Data Sources		Disconnects from all active data sources in the project.	 Data Sources
	Remove all Data Sources		Removes all data sources from the project.	 Data Sources
	Expand Siblings		Expands all folders on the same level as, or all children of, the selected item.	 Data Sources  SQL  Design  Data Diff  Schema Diff
	Expand Children			
	Collapse Siblings		Collapses all folders on the same level as, or all children of, the selected item.	 Data Sources  SQL  Design  Data Diff  Schema Diff
	Collapse Children			
	Add a new Data Source...		Opens the Add a Data Source dialog box where you can define a new data source connection.	 Data Sources
	Convert all to Global Resources		Converts all data sources in the project to global resources. Note that data source names must not contain blanks.	 Data Sources
	Connect		Connects to the selected data source.	Data source
	Disconnect		Disconnects from the selected data source.	Data source
	Remove	Del	Removes the selected item from the project.	Data source Sub-folders SQL file Design file Data comparison file Schema comparison file

	Rename	F2	Renames the selected item. Note that you can only rename disconnected data sources.	Data source Sub-folders
	Convert to Global Resource		Converts the selected data source into a global resource.	Data source
	Copy Global Resource into Project		Creates a copy of the global resource and adds it to the project as a normal data source.	Data source
	Edit Global Resource		Opens the Global Resource dialog box where you can edit the global data source connection.	Data source
	Create Folder...		Creates a sub-folder for the selected item.	 SQL  Design  Data Diff  Schema Diff
	Execute All SQL Files		Opens all SQL files that are contained in the SQL folder in new SQL Editor windows and executes them automatically. Note that a data source must be assigned to the files.	 SQL
	Open		Opens the selected file in its corresponding editor or comparison window, respectively.	SQL file Design file Data comparison file Schema comparison file
	Locate file...		Shows the selected file in Windows Explorer.	SQL file Design file Data comparison file Schema comparison file
	Execute SQL		Opens and executes the SQL file in an SQL Editor window. Note that a data source must be assigned to the file.	SQL file
	Remove all favorites		Removes all items from the Favorites folder.	 Favorites

4.1.2 Online Browser

Altova web site:  [database browser](http://www.altova.com/database-browser)

The Online Browser displays all the database objects of the database you are connected to. It is organized in folders for Tables, Views, XML Schemas, Procedures, and Functions and each of these folders provides sub-folders where the relevant column, key, data type, or constraint information is displayed (see *left screenshot*).

The Online Browser serves as a starting point for most of the database actions in DatabaseSpy: retrieve or edit data, create SQL statements, show database items in the Design Editor, compare data or schemas, export database data, or show the row count for tables. All these actions can be started from the Online Browser with a few mouse clicks.

The Online Browser is only populated when connections exist to data sources, or if the *Always show in Online Browser* check box has been activated for a data source in its properties.

This will always display the data source connection in the Online Browser, even if it is disconnected, and you can connect to a data source directly from within the Online Browser without having to change to the Project window first (see *right screenshot*).

Online Browser toolbar

Layout: Click this button to choose from among several [layouts](#) to display the database objects. In the default Folders layout, the database objects are presented in a hierarchical manner.

Filter folder content (Ctrl+Alt+F): Choose this button if you want to reduce the number of displayed items by means of a [filter](#).

Show Favorites: You can add database objects that you use frequently to your favorites, these objects appear then in bold in the Online Browser and are available in the Favorites folder of the Project window. The **Show Favorites** icon allows you to switch between viewing all objects and showing only favorites.

Object Locator (Ctrl+L): For finding specific objects in the database you can use the [Object Locator](#). This button toggles the Object Locator on and off.

Refresh Data Source (F5): Clicking this button refreshes the data source to reflect the latest changes in the database structure and updates the display of the Online Browser.

4.1.3 Properties Window

The Properties window always displays the properties of selected object in the active window. For a better overview, each element has assigned a particular color in the properties title bar. You can change these colors in the [Design Editor options](#). If no object is selected, the properties of the editor or comparison window itself will be displayed.

Hiding empty properties

You can customize the appearance of the Properties window by clicking one of the following buttons at the right edge of the header line:

Hide empty properties: Hides all lines where no entry appears.

Show empty properties: Restores all lines and displays also empty properties.

Displaying the count of child objects

For performance reasons, information on child objects of an element is loaded only on demand, that is, if that particular element is expanded in the Online Browser or displayed in the Design Editor. However, you can nevertheless obtain this information by clicking the appropriate "Update Count" field in the object properties.

If you expand an element to show its child objects, the number of objects will also be shown when you click the parent element again.

4.1.4 Overview Window

The **Overview window** serves as a navigator for large design files that occupy more space than is available in the Design Editor window. The Overview window shows the currently displayed area in the design and you can move the focus by clicking into the rectangle and moving it to the desired location in the design file.

By default, the Overview window is a tabbed window in the bottom left part of the application. You can, however, [undock the window and drag it](#) to any position within the application.

4.1.5 Data Inspector Window

The Data Inspector Window is a convenient way to display the content of large data cells when you have only limited space to view the data directly in the result grid. The Data Inspector can be called via the **View** menu or by clicking the **Show Data Inspector window**  while one or more data cells are selected in the [Result window](#) or in the [Database Data Comparison window](#).

You can resize the Data Inspector window to view all the data it contains, or dock it to the application. In addition, the following buttons are available in the Data Inspector:

Word wrap: Automatically wraps the text in the window so as to make all the text visible. This is a toggle command, that is, word wrap is turned off again if you click the button again.

Pretty Print: Displays the text in a hierarchical way so that the tags are indented properly.

Save As: Opens the standard Windows **Save As** dialog box where you can specify a path and file name for the content of the data cell. The default file format is XML for XML columns and text for any other columns. You can also choose a different file format if you select "All Files" in the **Save as type** drop down list.

4.2 Output Window

The **Output window** in DatabaseSpy contains loading and error messages. Underlined parts in the Output window are hyperlinks which enable you to jump to a certain database object in the Online Browser.

Toolbar options

The message window provides a toolbar and a context menu that allow for the navigation inside the messages and include filters for hiding certain parts of the message. The corresponding toolbar icons are shown to the left of the options if they are available.

Summary, Success, Warning, Error, Progress	When checked, this parts of the message are displayed in the message window.
 Next	Jumps to and highlights the next message.
 Previous	Jumps to and highlights the previous message.
 Copy message	Copies the selected message to the clipboard.
 Copy message with children	Copies the selected message including its children to the clipboard.
 Copy all	Copies all messages in the message window to the clipboard.
 Find	Opens the Find dialog box.
 Find previous	Jumps to the previous occurrence of the string specified in the Find dialog box.
 Find next	Jumps to the next occurrence of the string specified in the Find dialog box.
 Clear	Removes all messages from the message window.

In addition, the toolbar provides the following icon:

 Filter	Opens a popup menu from where you can select the individual message parts for display. Furthermore, you can check all or none of these options with a single mouse click by selecting either Check All or Uncheck All from the popup menu.

4.3 Charts Window

The Charts window serves to display selected data from the result grid in a graphical form. It contains nine tabs so that you can produce different charts from a single result grid or from different Result windows.

Toolbar options

Change Type	Opens the Chart Type dialog box where you can choose between pie, bar, line, and gauge charts and select several sub-types.
Change Appearance	Opens the Change Appearance dialog box which allows you to define titles, labels, axes, sizes, fonts, and 3d features (if applicable).
Select Data	Opens the Chart Data dialog box where you can choose the columns that should be depicted on the X- and Y-axes.
Export	Opens a submenu which allows you to save the chart, copy it to the clipboard or print the chart.
Reload	Reloads the data from the Result window. If the Auto toggle is activated, data is reloaded automatically when the source data is changed.

4.4 Database Structure Change Script

The **Database Structure Change Script** records any changes you make to the database structure in an SQL script. This script is either generated instantly or on demand, depending on the settings in the [Change Script options](#).

```

Database Structure Change Script
1  -- region change columns
2  ALTER TABLE [ZooDB].[dbo].[tblAnimalBirths] ALTER COLUMN [Mother]
   int NOT NULL ;
3  ALTER TABLE [ZooDB].[dbo].[tblFeedSuppliers] ALTER COLUMN
   [SupplierState] varchar (20) COLLATE SQL_Latin1_General_CP1_CI_AS
   NULL ;
4  -- endregion change columns
5  -- region creating tables
6  CREATE TABLE [ZooDB].[dbo].[visitors] ( [date] datetime NOT NULL ,
   [location] varchar (255) NULL , [total] int NULL ) ;
7  -- endregion creating tables
8  -- region adding columns
9  ALTER TABLE [ZooDB].[dbo].[tblFeedSuppliers] ADD [SupplierEmail]
   varchar (255) NULL ;
10 -- endregion adding columns
  
```

In order to provide a better overview if changes are made in large scale, the change script is structured into regions, which can be collapsed or expanded when checking the script. Please note that collapsing a region will not exclude this part of the script from execution; collapsed regions are expanded automatically when the change script is being executed.

If you have several data sources connected and you change the structure in more than one of them, a separate tab is created for each data source in the Database Structure Change Script window.

When defining [primary keys](#) or [check constraints](#), the Database Structure Change Script window also displays comments on the validity of the definition.

```

-- region adding check constraints
-- Error: missing expression for check constraint CK_1.
-- ALTER TABLE [ZooDB].[dbo].[table1] ADD CONSTRAINT [CK_1] CHECK ( )
-- endregion adding check constraints
  
```

Toolbar options

The following options are provided in the Database Structure Change Script toolbar:

 **Execute Change Script** Executes the change script and thus implements the recorded changes in the database. In the [Change Script options](#), you can define the time delay during execution of the script.

 **Stop** Terminates the execution of the change script, the remaining changes are not implemented in the database and the Database Structure Change Script window is cleared. This button is only visible while a change script is being executed.
Please note: When you click the **Stop** button, all changes that have not been executed so far will be lost.

**Generate Change Script**

Generates or updates, respectively, a change script that reflects all the changes you have made in the database design since the change script has last been updated. This button is only active if you have defined in the [Change Script options](#) that the change script be generated on demand.

**Edit Change Script**

Opens the change script in a new SQL Editor window where you can edit it.

Please note: The script will be removed from the Database Structure Change Script window and the changes will be lost unless you execute the script in the SQL Editor.

**Save Change Script**

Opens the standard Windows **Save As** dialog box where you can save the script as an SQL file.

**Discard Changes**

Discards all changes recorded in the change script. The changes you made in the design will not be implemented in the database and the Database Structure Change Script window will be cleared.

4.5 Editors and Comparison Windows

4.5.1 SQL Editor

Altova web site:  [SQL Editor](#)

The SQL Editor is used to display, edit, and execute SQL statements. It provides a [Message tab](#) that displays success or error messages and warnings, and a [Result tab](#) for queries where you also can edit data if the SQL Editor runs in Editing mode.

The toolbar options in an SQL Editor window are also included in the following menus:

In addition, the toolbar provides the following icons:

-  **Reparsing the whole document** Upon clicking this button the statements in the currently active SQL Editor window will be reparsed once again. This way, parsing errors that occurred during the initial parsing of the statement can be corrected automatically.
-  **Show/Hide execution target bar** Toggles the display of the [Execution Target Bar](#) on and off. Note that the Execution Target Bar will also be toggled off for all SQL Editor and Design Editor windows that you open subsequently.

Message Tab

The **Message tab** provides a statistical overview on the SQL statement that has been executed last and reports errors that might have occurred during execution.

Underlined parts in the Message tab are hyperlinks which enable you to jump to a certain part of the SQL script in the SQL Editor, or to the corresponding [Result tab](#) that holds the result of the respective SQL statement.

Message options

The message window provides a toolbar and a context menu that allow for the navigation inside the messages and include filters for hiding certain parts of the message. The corresponding toolbar icons are shown to the left of the options if they are available.

Summary, Success, Warning, Error, Progress	When checked, this parts of the message are displayed in the message window.
Next	Jumps to and highlights the next message.
Previous	Jumps to and highlights the previous message.
Copy message	Copies the selected message to the clipboard.
Copy message with children	Copies the selected message including its children to the clipboard.
Copy all	Copies all messages in the message window to the clipboard.
Find	Opens the Find dialog box.
Find previous	Jumps to the previous occurrence of the string specified in the Find dialog box.
Find next	Jumps to the next occurrence of the string specified in the Find dialog box.
Clear	Removes all messages from the message window.
Filter	Opens a popup menu from where you can select the individual message parts for display. Furthermore, you can check all or none of these options with a single mouse click by selecting either Check All or Uncheck All from the popup menu.

In addition, the toolbar provides the following icon:

Filter	Opens a popup menu from where you can select the individual message parts for display. Furthermore, you can check all or none of these options with a single mouse click by selecting either Check All or Uncheck All from the popup menu.

Result Tab

The **Result tab** of the SQL Editor shows the record sets that were retrieved as a result of the database query. If an SQL Editor window contains more than one query, the results are

displayed in individual tabs (see *screenshot below*) or stacked in a single window.

	SuYear	SuNations	SuSports	WiYear	WiNations	WiSports
1	1896	14	9	1924	16	9
2	1900	24	19	1928	25	6
3	1904	12	17	1932	17	4
4	1908	22	22	1936	28	4
5	1912	28	14	1948	28	4

Execution was successful Rows: 26, Cols: 6 0.657 sec 14:13:38

Message Figures Su/Wi NOCs w/ A NOCs w/ B

The status bar at the bottom of the window displays information on the progress of the query: whether the retrieval executed successfully, was aborted or has been stopped by the user. In addition, the number of rows and columns retrieved as well as the amount of time necessary for retrieval, and the time when the query was executed.

Maximum number of result tabs

In DatabaseSpy, a maximum number of 30 result tabs is allowed. If you execute a query that would produce more than 30 result tabs, only the first 30 result tabs are generated and a corresponding message is displayed in the message tab.

✖ Aborting retrieval of further results. Number of open result views is limited to 30.

Result options

When you right-click anywhere in the Result tab of the SQL Editor, a context menu opens which provides options for working with the results of a query. The corresponding Toolbar icons are shown to the left, and keyboard shortcuts to the right of the options if they are available. Please note that the available options in the content menu change dynamically depending on the command you have used for retrieving the data in the Result window. The Result tab can therefore be in three different states: Execution was successful, Stopped retrieval, or Editing mode.

✓ Execution was successful

The query has been started by executing a normal SELECT or by right-clicking tables, columns or views in the Online Browser and selecting **Retrieve data | All rows** from the context menu.

Go to statement

Jumps to the SQL Editor window and highlights the group of SQL statements that produced the respective result.

Auto Size Columns

Adjusts the column width of all columns to provide an optimized view of text contained in the columns. Please note that the maximum column width for auto-sizing in the Result tab is 250 pixels. In data cells containing a large amount of text, only the first part of the text is displayed followed by an ellipsis (...). You can, however, always drag the column border to show more text.

Selection	Allows you to select the row or column in which the cursor is currently positioned, or the entire table. Choose the desired option from the sub-menu.
Sorting	Opens a sub-menu to sort the table either ascending or descending and uses the column where the cursor is currently positioned as a sort key. To restore the default sort order, choose the corresponding option from the sub-menu.
 Copy selected cells Ctrl+C	Copies the selected cells to the clipboard. You can select several individual cells by holding down the Ctrl button and clicking the desired cells or select a consecutive number of neighboring cells by clicking a cell and pressing the Shift key while clicking a second cell. The content of the cells can be pasted as tabbed text into a text editor or spreadsheet calculator, or can replace existing cells in the result grid. This menu option is only available if data editing in the Result window is enabled.
Copy selected cells with header	Copies the selected cells as well as the corresponding headers (i.e., the column names) to the clipboard.
 Show in Data Inspector Window Show result toolbar	Opens the Data Inspector window where you can conveniently view the content of large data cells. Shows or hides the toolbar in the Result tab of the SQL Editor window.
Auto Hide Hide	currently not available Hides the Results tab of the SQL Editor window. In order to show the Results tab again, click the
Toggle Result Window(s)  button in the toolbar of the SQL Editor window or choose the menu option SQL Editor Result view .	
 Stopped Retrieval	The query has been started by right-clicking tables, columns or views in the Online Browser and selecting Retrieve data First n rows from the context menu. When the SQL Editor is in the Stopped Retrieval mode (i.e., not all rows of data have been retrieved yet or if the Stop Retrieval  button has been clicked), the following additional options are available in the Result tab:
 Retrieve next n rows	Retrieves the next n rows from the query in the active SQL Editor window.
 Retrieve outstanding rows	Retrieves all the remaining rows from the query in the active SQL Editor window.
 Editing Mode	The query has been started by executing a SELECT statement with the Execute for Data Editing command, or by right-clicking tables, columns or views in the Online Browser and selecting Edit data from the context menu. When the SQL Editor is in the Editing mode, the following additional options are available in the Result tab:

	Paste	Ctrl+V	Pastes the content of the clipboard into the cell—and, if applicable, its neighboring cells—where the cursor is currently positioned. Note that if you use the Edit cell command before pasting, the entire content of the clipboard will be pasted into the selected cell as tabbed text.
	Paste as new rows	Ctrl+Shift+V	Adds new rows to the result grid and pastes the content of the clipboard into the new rows. Note that only content that has been copied using the Copy selected cells command can be pasted as new rows.
	Edit cell		Enables the data cell for editing and selects the content of the cell. This menu option is only available if no limitations with regard to editing records apply.
	Set Null		Resets the cell to the NULL value.
	Set Default		Resets the cell to the default value. This menu option is only available if a default value has been defined for the cell.
	Undo Changes for this Cell		Rejects the changes that have been made to a data cell but not yet committed to the database.
	Append a new row	Alt+Ins	Adds a new line to the result grid, where you can add records to the database table. The data must be committed to the database by clicking the  button. This menu option is only available if no limitations with regard to adding records apply.
	Delete row		Deletes the row in which the cursor is currently positioned. This menu option is only available if no limitations with regard to deleting records apply.

In addition, the toolbar provides the following icons:

	Find	Opens a Find dialog box allowing you to search a particular string in the Result window.
	Maximize result view	Enlarges the size of the Result window to a maximum.
	Undo all changes	Rejects all changes that have been made in the result grid since the data has been selected from the database or since updated data has last been committed to the database, respectively. This toolbar option is only available if the Result window is in the Editing mode.
	Pin down	Pins the result tab so that it remains visible even if other queries are executed in the same window.
	Show Data in Chart Window	Opens the Select columns dialog box in which you can choose the columns that are to be used as source for the chart.

Special options for XML columns

When the Result window is in the Editing mode and XML columns are present in the current grid, the following menu opens if you click the  button:

- Load XML Document from File...** Opens the standard Windows **Open** dialog box from where you can choose an XML file to load into the selected cell in the result grid.
- Save XML Document to File...** Opens the standard Windows **Save As** dialog box where you can choose a location to save the content of the selected cell as XML file.
- Assign XML Schema...** Opens the **Choose XML Schema** dialog box where you can [assign an XML schema](#) for validation of the XML file stored in the database field.

Full XML support is currently only available for the following databases:

- DB2 9
- SQL Server 2005
- SQL Server 2008

In addition, DatabaseSpy provides limited XML support for databases of the following types:

- Oracle 9
- Oracle 10g
- Oracle 11g
- PostgreSQL 8.3

4.5.2 Design Editor

Altova web site:  [database design](#)

The **Design Editor** is a graphical user interface where you can view your database objects and their relations as graphical objects. A table including its columns, indexes, keys, and constraints is displayed in a so-called [table design](#) (see *screenshot below*). You can add new tables or edit existing ones or just drag a table into a Design Editor window to see what its structure looks like.

When you add new objects (e.g., tables or columns) to the database or change the structure of existing ones, these changes are not immediately effective in the database. Any changes in the database design are recorded in the [Database Structure Change Script](#) and can then either be executed or rejected.

Design options

When you right-click in an unoccupied area of the Design Editor, several general options are available in the context menu which are listed below. The corresponding Toolbar icons are shown to the left, and keyboard shortcuts to the right of the options if they are available.

	Create new Table	Ctrl+T Creates a new table in the currently active Design Editor window and automatically assigns it to the active data source, that is, the data source which is selected in the Online Browser.
	Add Sticky Note	Alt+N Adds a Sticky Note to the Design Editor window.
	Select Select User Tables	Alt+T Selects all user tables that are contained in the active Design Editor window.
	Select Select System Tables	Alt+S Selects all system tables that are contained in the active Design Editor window.

	Auto Layout whole Diagram	Shows the design in a hierarchical layout where all relations between the tables are considered and the tables are laid out properly.
	Save Diagram as Image	Saves the currently active design as Portable Network Graphic (*.png) or Enhanced Windows Metafile (*.EMF).

In addition, the toolbar provides the following icons:

			Changes the zoom factor of the Design Editor window; enter a value or select a zoom factor from the drop-down list.
	Zoom in	Ctrl+Num +	Increases the zoom factor of the Design Editor window by 10 percent. You can also zoom in by scrolling (with the scroll-wheel of the mouse) while keeping the Ctrl key pressed.
	Zoom Out	Ctrl+Num -	Decreases the zoom factor of the Design Editor window by 10 percent. You can also zoom out by scrolling (with the scroll-wheel of the mouse) while keeping the Ctrl key pressed.
	Zoom to Fit		Sizes the working area to include all tables in the current Design Editor window.
	Insert Referenced Tables		Inserts all related tables that are referenced by a constraint of the selected table.
	Insert Referencing Tables		Inserts all related tables that include a constraint referencing the selected table.
	Insert All Related Tables		Inserts both referenced and referencing tables.
	Expand selected Tables		Expands all tables that are selected in the current Design Editor window.
	Collapse selected Tables		Collapses all tables that are selected in the current Design Editor window.
	Snap to Grid	Ctrl+G	Shows/hides the grid and toggles the snap-to-grid function on and off.
	Export		Opens the Export database data dialog box where the Table radio button is already preselected.
	Update Change Script		Starts the generation of a change script or updates it after changes occurred to the database structure. Please note that this button is grayed out if in the General options you have activated the Instantly radio button in the Database Structure Change Script group box.
	Show Options		Opens the Design Editor options dialog box where you can customize the settings for the Design Editor.

When the Design Editor displays one or more tables, a variety of options is provided if you right-click into a table design. Which options are included in the context menu depends on where you click within the table design.

4.5.3 Data Comparison Window

The Data Comparison window allows users to select and display tables from two data sources (that may or may not be different) for the purposes of comparing the data in these tables. Mappings are defined either automatically by DatabaseSpy or manually by the user in this view. Mapping of tables can be fine-tuned to include a subset of the table's columns. Note that you need an [active connection](#) to a data source to be able to display a Data Comparison window.

Data comparison options

When you right-click in an unoccupied area of the Data Comparison window, several options are available in the context menu which are listed below. The corresponding Toolbar icons are shown to the left of the options if they are available.

Compare tables

Starts a data comparison of the tables that are currently mapped in the Data Comparison window.

Merge Left to Right

Merges the mapped tables so that the table on the right side is updated with the data of the table on the left side of the comparison. If you start this command from the toolbar and one or more tables are selected, only the selected tables will be merged.

	Merge Right to Left	Merges the mapped tables so that the table on the left side is updated with the data of the table on the right side of the comparison. If you start this command from the toolbar and one or more tables are selected, only the selected tables will be merged.
	Show results	Shows the result of the data comparison in a new tab of the Comparison Result View (if the data has not been compared yet) or displays the corresponding result tab (if the data has already been compared before).
	Open in new Schema Comparison	Opens all tables that are included in the data comparison in a new Schema Comparison window.
	SQL and Data Show merge script: Left to Right	Generates a merge script for all different tables in the data comparison and updates the table in the right component with the data from the table in the left component.
	SQL and Data Show merge script: Right to Left	Generates a merge script for all different tables in the data comparison and updates the table in the left component with the data from the table in the right component.
	SQL and Data Show restore script: Left	Generates a script for the left side of the comparison that restores the data to the values that were stored in the database before the merge. Note that the restore script must be generated before the merge script is executed!
	SQL and Data Show restore script: Right	Generates a script for the right side of the comparison that restores the data to the values that were stored in the database before the merge. Note that the restore script must be generated before the merge script is executed!
	Sort tables Ascending	Sorts the tables in the comparison component ascending.
	Sort tables Descending	Sorts the tables in the comparison component descending.
	Sort tables Ascending mapped first	Sorts the tables in the comparison component ascending and displays mapped tables on top.
	Sort tables Descending mapped first	Sorts the tables in the comparison component descending and displays mapped tables on top.
	Map items	Maps corresponding tables in the Data Comparison window.
	Unmap items	Removes all mappings from the Data Comparison window.
	Expand tables	Expands all tables in the Data Comparison window and shows the table columns.
	Collapse tables	Collapses all tables in the Data Comparison window.
	Autolayout	Optimizes the component size and tries to display as much of the two components as possible in the comparison window.

In addition, the toolbar provides the following icons:

	Stop Comparison	Stops the currently running comparison process. This button is only visible while a comparison is running.
	Toggle Message Window	Toggles the Message tab of the Data Comparison window on and off.
	Show Options	Opens the Data Compare page of the Options dialog box.

Compare Result View

The result of a database data comparison is displayed in the Compare Result View which also provides context menu options and toolbar buttons for merging data to the left or right side of the comparison.

If the tables contain columns with different data types on the left and right sides which prevent data from being merged in one of the tables, the toolbar contains two additional icons which can be used to show or hide such columns. Note that in the screenshot below the **Show/Hide columns which don't have any differences** option has been toggled off.

Comparison result options

The Compare Result view provides context menu options and toolbar buttons for filtering the content displayed in the Compare Result View, for navigating the differences, and for merging the differences between the two tables. The corresponding Toolbar icons are shown to the left, and keyboard shortcuts to the right of the options if they are available.

Auto Size Columns

Adjusts the column width for all columns in the result grid so as to display the content properly.

Show/Hide all equal rows

Shows or hides rows that are equal in the left and right table.

Show/Hide all different rows

Shows or hides rows that are different in the left and right table.

Show/Hide rows that are only on the left

Toggles on and off the display of rows that are present in the left table only.

	Show/Hide rows that are only on the right	Toggles on and off the display of rows that are present in the right table only.
	Show/Hide rows that cannot be merged from left to right	Shows or hides rows that are different in the left and right component and can be merged only from the right to the left side and not from the left to the right side. This button is only visible if columns with conflicting data types are compared.
	Show/Hide rows that cannot be merged from right to left	Shows or hides rows that are different in the left and right component and can be merged only from the left to the right side and not from the right to the left side. This button is only visible if columns with conflicting data types are compared.
	Next difference	Selects the next difference as the current difference.
	Previous difference	Selects the previous difference as the current difference.
	Last difference	Selects the last difference in the document as the current difference.
	First difference	Selects the first difference in the document as the current difference.
	Merge data from left to right	Updates the selected data cell in the right table using the data contained in the data cell of the left table. Note that the change is committed to the database immediately without a change script being generated.
	Merge data from right to left	Updates the selected data cell in the left table using the data contained in the data cell of the right table. Note that the change is committed to the database immediately without a change script being generated.
	Copy selected cells Ctrl +C	Copies the selected cells to the clipboard. You can select several individual cells by holding down the Ctrl button and clicking the desired cells or select a consecutive number of neighboring cells by clicking a cell and pressing the Shift key while clicking a second cell. The content of the cells can be pasted as tabbed text into a text editor or spreadsheet calculator.
	Copy selected cells with header	Copies the selected cells as well as the corresponding headers (i.e., the column names) to the clipboard.
	Hide	Hides the Compare Result view of the Data Comparison window. In order to show the Compare Result view again, select the table in one of the components and click the Show result button in the toolbar of the Data Comparison window or choose the menu option Data Comparison Show results .

Additionally, the toolbar provides the following icons:

	Show/Hide columns which don't have any differences	Toggles on and off the display of columns that are equal in the left and right table.
	Find	Opens the Find dialog box where you can search for data in the Compare Result View.
	Show the Data Inspector window	Displays the content of the selected cell in the Data Inspector window.
	Go to table mapping	Shows the mapping of the compared tables in the Data Comparison window.

-  **Maximize the result window** Enlarges the size of the Compare Result View to a maximum. To display the Data Comparison window again, click the **Go to table mapping** button.

4.5.4 Schema Comparison Window

The Schema Comparison window allows users to choose two schemas from two data sources (that may or may not be different) and display their items for the purpose of comparing the structure in these schemas. Mappings are defined either automatically by DatabaseSpy or manually by the user in this view.

Schema comparison options

When you right-click in an unoccupied area of the Schema Comparison window, several options are available in the context menu which are listed below. The corresponding Toolbar icons are shown to the left of the options if they are available.

-  **Compare items** Starts a schema comparison of the items that are currently mapped in the Schema Comparison window.

	Show merge script: Left to Right	Generates a merge script for all different items in the schema comparison and updates the structure of the items in the right component with the structure of the items in the left component. If you start this command from the toolbar and one or more items are selected, the merge script will be generated only for the selected items.
	Show merge script: Right to Left	Generates a merge script for all different items in the schema comparison and updates the structure of the items in the left component with the structure from the items in the right component. If you start this command from the toolbar and one or more items are selected, the merge script will be generated only for the selected items.
	Open in new Data Comparison	Opens all tables that are included in the schema comparison in a new Data Comparison window
	Sort items Ascending	Sorts the items in the comparison component ascending.
	Sort items Descending	Sorts the items in the comparison component descending.
	Sort items Ascending mapped first	Sorts the items in the comparison component ascending and displays mapped items on top.
	Sort items Descending mapped first	Sorts the items in the comparison component descending and displays mapped items on top.
	Map items	Maps corresponding items in the Schema Comparison window.
	Unmap items	Removes all mappings from the Schema Comparison window.
	Expand items	Expands all items in the Schema Comparison window and shows the child objects of the items.
	Collapse tables	Collapses all tables in the Schema Comparison window.
	Autolayout	Optimizes the component size and tries to display as much of the two components as possible in the comparison window.

In addition, the toolbar provides the following icons:

	Stop Comparison	Stops the currently running comparison process. This button is only visible while a comparison is running.
	Toggle Message Window	Toggles the Message tab of the Schema Comparison window on and off.
	Show Options	Opens the Data Compare page of the Options dialog box.

4.6 Execution Target Bar

The Execution Target Bar is an optional toolbar which displays the data source and root object currently assigned to the SQL Editor window or—if the data source connection is active—the Design Editor.

The Execution Target Bar is switched on for all SQL Editor windows by default. To hide the bar for individual SQL Editor windows, click the **Show/Hide execution target bar**  button in the SQL Editor toolbar. Note that disabling the Execution Target Bar for an SQL Editor window will deactivate it in all SQL Editor and Design Editor windows that you open subsequently.

When you move your mouse cursor over the Execution Target Bar, the different elements appear as hyperlinks, enabling you to jump the Properties window where you can change the respective element.

Data source offline

If the data source to which an SQL Editor window is assigned is offline, the Execution Target Bar provides a **Connect** button for conveniently establishing a connection.

No data source defined

For an SQL Editor window that has no data source defined, you can use the hyperlink functionality to jump to the Properties window if you want to specify a data source. Click the "Offline" text in the Execution Target Bar to access the **Data Source** drop-down list where you can select a data source for the SQL Editor window.

Differing root objects

If the root object specified for the SQL Editor window differs from the root object of the data source the window is currently connected to, the execution target bar shows a tooltip providing a more detailed description of the problem when you place the mouse cursor over its icon. By clicking the **Synchronize** button you can set the SQL script's root object to the currently active root object of its data source.

4.7 Menu Bar, Toolbars, and Status Bar

The **menu bar** contains the various application menus. The following conventions apply:

- If commands in a menu are **not** applicable in an editor or at a particular location in the document, they are unavailable.
- Some menu commands pop up a sub-menu with a list of additional options. Menu commands with sub-menus are indicated with a right-pointing arrowhead to the right of the command name.
- Some menu commands pop up a dialog that prompts you for further information required to carry out the selected command. Such commands are indicated with an ellipsis (...) after the name of the command.
- To access a menu command, click the menu name and then the command. If a sub-menu is indicated for a menu item, the submenu opens when you mouseover the menu item. Click the required sub-menu item.
- A menu can be opened from the keyboard by pressing the appropriate key combination. The key combination for each menu is **Alt+KEY**, where **KEY** is the underlined letter in the menu name. For example, the key combination for the **File** menu is **Alt+F**.
- A menu command (that is, a command in a menu) can be selected by sequentially selecting (i) the menu with its key combination (see previous point), and then (ii) the key combination for the specific command (**Alt+KEY**, where **KEY** is the underlined letter in the command name). For example, to open a file (**File | Open**), press **Alt+F** and then **Alt+O**.
- Some menu commands can be selected **directly** by pressing a special **shortcut** key or key combination (**Ctrl+KEY**). Commands which have shortcuts associated with them are indicated with the shortcut key or key combination listed to the right of the command. For example, you can use the shortcut key combination **Ctrl+N** to open a new SQL Editor; the shortcut key **F2** to rename a database object.

Toolbars

The toolbars contain buttons that are shortcuts for commands found in the menus. The name of the command appears when you place your mouse pointer over the button. To execute the command, click the button.

Toolbar buttons are arranged in groups. In the [Tools | Customize | Toolbars](#) dialog, or when right-clicking into the toolbar and selecting **Customize**, you can specify which toolbar groups are to be displayed. In the GUI, you can also drag toolbar groups by their handles (or title bars) to alternative locations on the screen. Double-clicking the handle causes the toolbar to undock and to float; double-clicking its title bar causes the toolbar to dock at its previous location.

Status Bar

The Status Bar is located at the bottom of the application window and displays (i) status information about the connection to data sources, the loading of database content, and the loading of files, and (ii) information about menu commands and command shortcuts in the toolbars when the mouse cursor is placed over these. If you are using the 64-bit version of DatabaseSpy, this is indicated in the status bar with the suffix (x64) after the application name. There is no suffix for the 32-bit version.

4.8 Arranging the Information Windows

All information windows can be docked/undocked by double-clicking the title bar. When docked, the auto-hide feature can be activated by clicking the drawing-pin icon in the title bar. When auto-hidden, the window is minimized as a tab at an edge of the application window. An auto-hidden window can be re-docked by rolling it out from the edge (by mousing over its tab) and clicking the drawing-pin icon in the title bar. When you click the little arrow that is located to the right of a data source connection or favorite item and shows the respective object in the Online Browser, DatabaseSpy will automatically hide the Project window and roll out the Online Browser to display the object.

Context Menu

The context menu can be accessed by right-clicking a window tab or title bar.

Click the required option to cause that window to float, be docked, or be auto-hidden or hidden.

Drag-and-drop

You can drag a window by its tab or title bar and place it at a desired location.

Additionally, you can dock the window in another window or in the interface using placement controls that appear when you drag a window:

- When you drag a window over another window, a placement control appears (see *screenshot below*). This control is divided into five placement sectors. Releasing the mouse key on any of these sectors docks the dragged window into the respective sector of the target window. The four arrow sectors dock the dragged window into the respective sides of the target window. The center button docks the dragged window as a tab of the target window. You can also dock a window as a tab in another window by dragging it to the tab bar and dropping it there.

- When you drag a window, a placement control consisting of four arrows appears. Each arrow corresponds to one side of the Editor or Comparison window, respectively. Releasing a dragged window over one of these arrows docks the dragged window into one side of the Editor or Comparison window, respectively.

You can also double-click the title bar of a window to toggle it between its docked and floating positions.

Chapter 5

Tutorials

5 Tutorials

This section contains the following tutorials:

- [DatabaseSpy QuickStart Tutorial](#): A tutorial that runs you through the main features of DatabaseSpy, that are: connecting to a database, browsing the database and viewing its structure, querying and editing data in the database, and importing and exporting data.
- [DatabaseSpy Tutorial](#): A tutorial that provides you with in-depth information on all of DatabaseSpy's features. You will learn how to create a database from scratch and how to use DatabaseSpy to maintain the data in it by using the SQL Editor and the Design Editor.

5.1 DatabaseSpy QuickStart Tutorial

This tutorial takes you through several tasks which provide an overview of how to use DatabaseSpy, using an example Microsoft Access 2003 database.

You will learn how to:

- [Connect](#) to an existing Microsoft Access 2003 database
- [Browse the data](#) in the database
- [View](#) database structure and relationships graphically
- [Query](#) the database and create a view from that query
- [Update data](#) and [add](#) as well as [delete](#) table rows
- Generate a script to [import data](#) into the database
- [Export data](#) from the database to XML files

Installation and configuration

This tutorial assumes that you have successfully installed DatabaseSpy on your computer and received a free evaluation key-code, or are a registered user of the product. The evaluation version of DatabaseSpy is fully functional but limited to a 30-day period. You can request a regular license from our secure web server or through any one of our resellers.

Tutorial example files

The tutorial files are available in the \Altova\DatabaseSpy2012\DatabaseSpyExamples\Tutorial sub-folder of the [\(My\) Documents](#) folder. A project containing a connection to a Microsoft Access 2003 database is also available to you in the tutorial folder. The project also contains SQL scripts that will be used in the course of this tutorial.

5.1.1 Connecting to a Database

DatabaseSpy uses **projects** to organize databases and SQL files. Before you can connect to a database in DatabaseSpy, you must therefore create or open a database project. In order to provide you with a quick overview of the most important features of DatabaseSpy, a tutorial project has been added to the installation files and is available in the \Altova\DatabaseSpy2012\DatabaseSpyExamples\Tutorial sub-folder of the [\(My\) Documents](#) folder. Instructions on how to create a new project from scratch can be found in the [DatabaseSpy Tutorial](#).

Objective

In this section of the tutorial, you will learn how to connect to a database. Specifically, you will learn how to do the following:

- [Open](#) an existing database project
- [Connect](#) to a data source

Commands used in this section

Open project: This command is located in the Project window in the menu bar. Click this icon to display the standard Windows **Open** dialog box where you can choose an existing database project.

Connect: This command is located in the context menu that opens when you right-click a data source connection name. You can also double-click the data source connection name to connect to the database.

Opening an Existing Database Project

To connect to a database in DatabaseSpy, you must first start DatabaseSpy and then add a data source to a DatabaseSpy project. For the QuickStart Tutorial, a project is already available

in the \Altova\DatabaseSpy2012\DatabaseSpyExamples\Tutorial sub-folder of the [\(My\) Documents](#) folder.

Starting DatabaseSpy

To start DatabaseSpy, double-click the DatabaseSpy icon on your desktop or use the **Start | All Programs** menu to access the DatabaseSpy program. DatabaseSpy is started with a new, empty project and displays the **Add a Data Source** dialog box by default. Close the dialog box to begin with the tutorial.

To open an existing database project:

1. Select the menu option **File | Open | Open project**.
The **Open** dialog box is displayed.
2. Select the `access_db` project that is available in the tutorial folder.
3. Click **Open**.
The `access_db` project appears in the Project window and the data source connection `TutorialDB` is displayed in the Data Sources folder.

Connecting to a Data Source

Once you have created a project and added a data source to it, you must connect to this data source to gain access to your database.

To connect to a data source:

- In the Project window, double-click the data source connection name `TutorialDB` in the Data Sources folder, or right-click it and choose **Connect** from the context menu.
The color of the connection icon changes to green and an arrow appears to the right of it.

5.1.2 Browsing the Database

The **Online Browser** of DatabaseSpy displays all database objects of a connected data source. You can view the tables or retrieve data with a single mouse click, or navigate between the individual database objects using the navigation bar.

Objective

In this section of the tutorial, you will learn how to browse the structure and view the data of the example database in the Online Browser. Specifically, you will learn how to do the following:

- [Display the database tables](#) in the Online Browser

- [Retrieve data](#) from a specific table

Please note: By default, the Online Browser is available only for connected data sources. To be able to view disconnected database objects in the Online Browser, you must either first [connect to the database](#) in the Project window or activate the `Always show in Online Browser` check box in the data source properties.

Commands used in this section

Show in Online Browser: This command is located to the right of an active data source connection in the Project window. Click the arrow to activate the Online Browser tab.

Retrieve data: This command is included in the context menu that opens when you right-click a database table or column. Choose a command from the sub-menu to query the selected table or column.

Displaying Tables in the Online Browser

The Online Browser displays the database structure hierarchically and allows for displaying the tables and columns included in a database as well as viewing and changing their properties.

To be able to see the database structure in the Online Browser, you must [connect to the data source](#) connection.

To display the database tables in the Online Browser:

1. If the data source is not connected, [connect to the database](#).
2. In the Project window, click the arrow to the right of the `TutorialDB` connection you just made active.

Alternatively, you can also click the Online Browser tab.

The Online Browser window is now active. The `Course`, `Department`, and `Teachers` tables that comprise the edu database are now visible in the User Tables folder.

Retrieving Data from Tables

The Online Browser makes it easy to retrieve and view data from any table. The context menu that opens when you right-click any database object in the Online Browser provides an option that opens an SQL Editor window, generates a query and automatically executes it.

```
1  SELECT [id],
2      [name]
3  FROM   [Teachers];
```

The query is shown in the top pane of the SQL Editor and the retrieved data is shown in the Result tab below.

The screenshot shows a window titled 'Result1' with a toolbar and a table of results. The table has two columns: 'id' and 'name'. There are five rows of data. Below the table, a status bar indicates 'Execution was successful Rows: 5, Cols: 2 0.516 sec 13:28:48'. At the bottom, there are tabs for 'Message' and 'Result1'.

	id	name
1	0	Mr Smith
2	1	Mrs Jones
3	2	Mr Patel
4	3	Mr Harris
5	4	Ms Wong

To retrieve data from the Teachers table:

- In the Online Browser, right-click the Teachers table and select **Retrieve data | All rows** from the context menu. Alternatively, select the table and press the keyboard shortcut **Ctrl+Alt+R**.

The SQL statement and the results of the query appear in a new SQL Editor window. You might have to click the maximize button of the SQL Editor window to see more of the data.

5.1.3 Viewing the Database Structure

DatabaseSpy's **Design Editor** allows for a graphical display of individual database objects or even the entire database structure. You can drag and drop database elements into a Design Editor window or select the respective option from the context menu. The content of Design Editor windows can be saved to design files or images.

Objective

In this section of the tutorial, you will learn how to display a graphical overview of the database structure in the Design Editor. Specifically, you will learn how to do the following:

- Open a Design Editor window from the toolbar
- Drag and drop database elements into a Design Editor window
- Optimize the layout of a Design Editor window

Commands used in this section

Design Editor: This command is located in the **File | New** menu and is also available as a toolbar icon in the Standard toolbar. Selecting this command opens a new Design Editor window assigned to the active data source connection.

Show in new Design Editor: This command is located in the context menu of the selected database object. Choosing this command displays the selected database object in a new Design Editor window.

Hierarchical layout: This command is available as toolbar icon in the toolbar of the Design Editor window. Alternatively, you can also use the menu option **Design Editor | Auto Layout whole Diagram** to show you database objects in the Design Editor in a properly laid-out way.

Showing Tables in the Design Editor

You have two possibilities to show tables in the Design Editor: Either you first open a new Design Editor window in the **File** menu or from the Standard toolbar and then drag and drop the selected database elements, or you right-click the database elements in the Online Browser and choose **Show in new Design Editor** from the context menu.

To open a new Design Editor window:

- Click the **Design Editor**  icon in the Standard toolbar, or select the menu option **File | New | Design Editor**, or press **Ctrl+D**.

An empty Design Editor window is displayed and assigned to the active data source connection `TutorialDB`. Note that the window contains a brief instruction on how to

get started with the Design Editor. This text box will disappear as soon as you drag database objects into, or create a new table in, the Design Editor.

To show tables in the Design Editor:

- In the Online Browser, select the `Course`, `Department`, and `Teachers` tables and drag and drop the tables into the Design Editor window. You can do this by dragging them individually, or using **Ctrl+click** to select them as a group.

Alternatively, you can also right-click the tables and choose **Show in new Design Editor** from the context menu.

To auto-layout the Design Editor window:

- In the toolbar of the Design Editor, click the **Hierarchical Layout**  icon to optimize the formatting.

5.1.4 Querying the Database

DatabaseSpy allows you to query a database by choosing a menu option from the context menu in the Online Browser or to execute SQL scripts directly from the Project window.

Objective

In this section of the tutorial, you will learn how to query a database and how to create a view. Specifically, you will learn how to do the following:

- [Execute](#) a SELECT statement provided as an SQL script
- [Create a view](#) from that statement
- [Retrieve data from a view](#)

Commands used in this section

Open: This command is located in the context menu of SQL files stored in the SQL folder and opens the selected file in the SQL Editor. It is also the default option when double-clicking these files.

Execute SQL: In the Project window, this command is located in the context menu of SQL files stored in the SQL folder. If an SQL Editor window containing a script is already open, this command can also be called from the **SQL Editor** menu or by clicking the **Execute** button in the toolbar of the SQL Editor window. Choosing this command immediately executes the SQL and shows the results in a Result tab.

Create View As: This command is located in the context menu that opens when you right-click anywhere in an SQL Editor window. Alternatively, you can also select the menu option **SQL Refactoring | Create View As**. Choosing this option creates a view of the query in the active SQL Editor window and stores that view in the Views folder.

Refresh: This command is located in the context menu that opens when you right-click a database in the Online Browser and it is also available as an icon in the toolbar of an SQL Editor window. Clicking this menu option refreshes the display of the database in the Online Browser.

Current statement: This command is located in the toolbar of an SQL Editor window. Click this icon to select the statement in which the cursor is currently located.

Executing an SQL Script

In DatabaseSpy, SQL scripts can be stored together with the database connection in the SQL folder of the project. This way, scripts that you use frequently are at hand any time and you can execute them with a double-click.

To execute an SQL script:

1. In the Project window, double-click the SQL folder if it is not already expanded. The SQL scripts in the project appear below the SQL folder.
2. Double-click the `Demo Queries.sql` entry. An SQL Editor window containing the script opens.

```
1      -- All Teachers in the Art Department
2      -- target: Art Teachers
3
4      SELECT Teachers.name as [Teacher Name], Course.name
      as [Course Name] FROM Teachers, Course WHERE Course.
      teacherid = Teachers.id AND Course.deptid = 2;
```

3. In the Properties window, make sure that "Semicolons" is selected in the Group statements for execution with drop-down list.

4. Click the **Execute**  button or press **F5**.

The results of the query appear in a results tab named "Art Teachers".

Creating a View

A view is a stored query. Views are stored in a separate folder in the Online Browser and can be used like tables. You can use DatabaseSpy to create a view from a SELECT statement.

To create a view from the SELECT statement:

1. In the SQL Editor window, right-click into the statement and select **Create View As** from the context menu. Alternatively, select the menu option **SQL Refactoring | Create View As**.
The statement is changed into a CREATE VIEW statement, and the `View1` placeholder is automatically highlighted.

```
1      -- All Teachers in the Art Department
2      -- target: Art Teachers
3
4      CREATE VIEW [View1] AS SELECT Teachers.name as
[Teacher Name], Course.name as [Course Name] FROM
Teachers, Course WHERE Course.teacherid = Teachers.
id AND Course.deptid = 2;
```

2. Change the view name from "View1" to "ArtTeacherView".

```

1      -- All Teachers in the Art Department
2      -- target: Art Teachers
3
4      CREATE VIEW [ArtTeacherView] AS SELECT Teachers.name
      as [Teacher Name], Course.name as [Course Name]
      FROM Teachers, Course WHERE Course.teacherid =
      Teachers.id AND Course.deptid = 2;

```

3. In the Properties window, make sure that "Semicolons" is selected in the Group statements for execution with drop-down list.
4. Click the **Execute**  button or press **F5**.
A view is created in the edu database. Execute the statement to get a table that shows which teachers are teaching which courses.
5. Right-click the edu database in the Online Browser and select **Refresh** from the context menu or click the **Refresh** button in the toolbar of the Online Browser.
The Online Browser shows a new folder called Views and the newly created view appears in this folder (you may have to double-click the Views folder to see the view).

Retrieving Data from a View

Creating views considerably facilitates the querying of a database. Let's assume that you frequently need to select the Art teachers and their courses from our tutorial edu database. A view allows you to query the view as you would query any table, i.e., by creating a view named "ArtTeacherView", instead of typing the statement

```

SELECT Teachers.name as [Teacher Name], Course.name as [Course Name]
FROM Teachers, Course WHERE Course.teacherid = Teachers.id AND Course.
deptid = 2

```

you can simply type

```

SELECT * FROM [ ArtTeacherView]

```

and will receive the same results in the Result tab. What is more, you can also use the context menu options in the Online Browser to retrieve data or generate SQL statements.

To enter a SELECT statement for a view:

1. Add a semicolon to the CREATE VIEW statement in the SQL Editor window and hit **Enter**.
2. Enter the statement `SELECT * FROM [ ArtTeacherView]`
3. To execute only the SELECT statement in the SQL Editor, select the statement using the mouse or the **Current statement**  icon in the toolbar.

```
1  -- All Teachers in the Art Department
2  -- target: Art Teachers
3
4  CREATE VIEW [ArtTeacherView] AS SELECT
    Teachers.name as [Teacher Name], Course.name
    as [Course Name] FROM Teachers, Course WHERE
    Course.teacherid = Teachers.id AND Course.
    deptid = 2;
5  SELECT * FROM [ArtTeacherView]
```

4. In the Properties window, make sure that "Semicolons" is selected in the Group statements for execution with drop-down list.
5. Click the **Execute**  button or press **F5**.
The results of the executed SQL statement are displayed in the Result1 tab.

To retrieve data from a view:

- In the Online Browser, right-click the `ArtTeacherView` and select **Retrieve data | All rows** from the context menu. Alternatively, you can also select the view and press **Ctrl+Alt+R**.

A SELECT statement is generated in a new SQL Editor window and executed automatically. The results of the query are displayed in the Result1 tab.

5.1.5 Updating Database Data

In DatabaseSpy, you can edit table content directly in the Result window of the SQL Editor. For this purpose, you have to switch the Result window into the Editing mode first. Then you can change the content of the individual cells and add or delete rows in the result grid.

Objective

In this section of the tutorial, you will learn how to switch the Result window into the Editing mode and how to edit database data in the Result grid. Specifically, you will learn how to do the following:

- [Select a table for editing](#) in the Result window
- [Execute a SELECT statement](#) to make data editable in the Result window
- [Change the content](#) of individual database fields
- [Add an additional row](#) of database data to the result grid
- [Delete a row](#) of database data in the result grid

Commands used in this section

Edit Data: This command is located in the context menu that opens when right-clicking a table or column in the Online Browser. Choose this command to generate an SQL SELECT statement that is automatically executed in the SQL Editor and switches the Result window into the Editing mode. This command works for all supported database kinds for both ADO and ODBC connections.

Execute for Data Editing: This command is located in the **SQL Editor** menu and is available as an icon in the SQL Editor toolbar. Click this command to execute a SELECT statement in the SQL Editor and switch the Result window into the Editing mode. Please note that this command works only for SELECT statements, and may be available only for a limited number of database kinds when connected via ADO connections.

 **Commit**: This command is available as a button in the Result window toolbar. Click this button to commit the changes you have made in the result grid to the database. The **Commit** button is only visible if the Result window is in the Editing mode.

 **Append a new row**: This command is available as a button in the Result window toolbar. Click this button to add a new row to the result grid. Alternatively, you can also right-click anywhere in the result grid and choose **Append a new row** from the context menu. The **Append a new row** command is only available if the Result window is in the Editing mode.

 **Delete row**: This command is available as a button in the Result window toolbar. Click this button to delete the row in which the cursor is currently located. Alternatively, you can also right-click a cell in the row to be deleted and choose **Delete row** from the context menu. The **Delete row** command is only available if the Result window is in the Editing mode.

Selecting a Table for Editing

In order to be able to modify the table content in your tutorial database, you have to switch the Result window of the SQL Editor into the Editing mode. Whether or not data can be edited in the result grid is indicated by the status bar of the Result window.

 Editing Mode

The easiest way to modify table data in the Result window is to right-click the respective table in the Online Browser and choose the **Edit Data** command from the context menu (see *screenshot*).

DatabaseSpy creates a SELECT statement in a new SQL Editor, executes it immediately, and switches the Result window into the Editing mode. The Editing mode is indicated in the Status bar and the Result window toolbar shows four additional icons.

	id	name
1	0	Mr Smith
2	1	Mrs Jones
3	2	Mr Patel
4	3	Mr Harris
5	4	Ms Wong

You can now double-click or right-click a cell in the result grid and [update the table content](#). Some columns may not be editable because they are identity columns or are computed using content from other columns, for instance.

To select the Teachers table for editing:

- In the Online Browser, right-click the Teachers table and select **Edit Data** from the context menu. Alternatively, you can also select the table and press **Ctrl+Alt+E**.

Executing for Data Editing

DatabaseSpy provides an additional way to switch the Result window into the Editing mode: You can execute a SELECT statement that is already present in an SQL Editor window for editing. Please note, however, that this option may be restricted to ODBC connections for some databases.

When supported for the currently used data source connection, the **Execute for Data Editing** command is available in the **SQL Editor menu** and as a  button in the SQL Editor toolbar. You can start the editing from the Online Browser like any normal retrieval.

DatabaseSpy creates a SELECT statement in a new SQL Editor window.

```
1  SELECT [id],
2      [name]
3  FROM [Teachers];
```

You can now choose from among the following options:

- Click the **Execute**  button for a normal retrieval.
- Click the **Execute for Data Editing**  button to switch the Result window into the

Editing mode and allow for updating the table data.
 Only one SELECT statement may be present in the SQL Editor window at a time.
 Please note that editing of data may be restricted to particular columns or—depending on the data source connection you are using—may not be possible at all. Please see chapter Editing database data for details.

To execute a SELECT statement for data editing:

1. In the Online Browser, right-click the Teachers table and select **Show in new SQL Editor | Select** from the context menu.
2. In the SQL Editor, click the **Execute for Data Editing**  button in the SQL Editor toolbar. Alternatively, you can also choose the menu option **SQL Editor | Execute for Data Editing**.

Updating Table Content

When the Result window is in the Editing mode, you can edit the data that is displayed in the result grid like in any common spreadsheet application. Double-click a cell in the result grid and update the content as required. Set a database field to NULL or assign the default value with a click of the mouse. You can also undo the changes that you have made to a cell.

Let's assume that you need to change the course structure in your edu database that you use in this tutorial. First, [select](#) the Course table for editing to see the current structure and switch the Result window into the Editing mode so that you are able to make your changes directly in the result grid.

Result1						
						
	id	name	descr	deptid	teacherid	upperlimit
1	0	Chemistry 101	First year Chemistry	0	2	70
2	1	Algebra 101	First year Algebra	1	0	65
3	2	Biology 102	First year Biology	0	1	70
4	3	Calculus 102	First year Calculus	1	0	65
5	4	Biology 202	Second year Biology	0	1	40
6	5	Music 101	Entry level instrumental music	2	3	30
7	6	Music 102	Entry level vocal	2	4	15
8	7	Art 101	Entry level visual arts course	2	4	40

Now make the following changes to the Course table:

- Change the number in the name column so that its three digits reflect the year, the department, and a consecutive number
- Set the teacherid column for "Entry level instrumental music" to NULL (let's assume the teacher retired and no replacement has been nominated yet)
- Set the upper limit for "First year Calculus" to the default of "70".

	id	name	descr	deptid	teacherid	upperlimit
1	0	Chemistry 101	First year Chemistry	0	2	70
2	1	Algebra 111	First year Algebra	1	0	65
3	2	Biology 102	First year Biology	0	1	70
4	3	Calculus 112	First year Calculus	1	0	70
5	4	Biology 201	Second year Biology	0	1	40
6	5	Music 121	Entry level instrumental music	2	NULL	30
7	6	Music 122	Entry level vocal	2	4	15
8	7	Art 123	Entry level visual arts course	2	4	40

The changes have so far only be made in the result grid, they have not been committed to the database yet. DatabaseSpy provides the **Undo changes for this cell** command in the context menu to undo the changes for an individual cell, and furthermore allows you to also undo all changes that have been made. In the toolbar, the **Undo all**  button is activated for this purpose. To save the changes and commit the new data to the database, you have to click the **Commit**  button.

To update the Course table in the Result window:

1. In the Online Browser, right-click the Course table and select **Edit Data** from the context menu.
2. In the Result window, double-click the respective fields in the name column and change the subject numbers so that they reflect the following pattern: first digit: year, second digit: department id, third digit: consecutive number.
3. Right-click the teacherid field in the sixth row (Entry level instrumental music) and choose **Set Null** from the context menu.
4. Right-click the upperlimit column in the fourth row (First year Calculus) and choose **Set Default** from the context menu.
5. Click the  button to save the changes and commit the data to the database.

Adding Table Rows

You can add new records to a table by appending a new row to the grid in the Result window and entering the required data. DatabaseSpy provides an option in the SQL Editor options to automatically enter the default values of the individual columns into the new row.

To add a new subject to the Course table:

1. Make sure that the Result window is still in the [Editing mode](#) and the content of the Course table is displayed.
2. Optionally, select the menu option **Tools | Options** and activate the `Initialize cells with default values` check box in the Data Editing group box of the SQL Editor: Result View section.

3. In the Result window, click the **Append a new row**  icon in the toolbar.

7	6	Music 102	Entry level vocal	2	4	15
8	7	Art 101	Entry level visual arts course	2	4	40
9	8	NULL	NULL	0	0	70

Note that the default value of "70" has been automatically inserted into the upperlimit column. All other columns do not have a default value defined, therefore "0" or "NULL", respectively, is inserted. If the inserting of default values option is deactivated in the SQL Editor options, a blank line is inserted.

- Using the Tab key to jump to the next field, enter the following values:

8		Music 221	Intermediate level vocal	2	4	15

- Click the  button to save the changes and commit the data to the database.

Deleting Table Rows

Unneeded table rows can be easily deleted when the Result window is in the Editing mode. The row is first marked for deletion in the result grid and you need to confirm the deletion by clicking the  button.

Let's assume that the "Entry level visual arts course" will not be available for students anymore and has to be removed from the list of courses in the tutorial database. To do so, place the cursor in a field of the row and click the **Delete row**  button in the toolbar. The row is marked for deletion in the result grid.

6	5	Music 101	Entry level instrumental music	2	3	30
7	6	Music 102	Entry level vocal	2	4	15
8	7	Art 101	Entry level visual arts course	2	4	40

Note that the row is still present in the database and that you can still undo the deletion by clicking into the deleted row and choosing **Undo Changes for this Cell** from the context menu.

To actually delete the row from the table, you have to click the  button. The row is removed from the result grid and no longer available in the database.

To delete a course from the Course table:

- Make sure that the Result window is still in the [Editing mode](#) and the content of the Course table is displayed.
- In the Result window, place the cursor in any cell of the eighth row (Entry level visual arts course).
- Click the **Delete row**  button in the toolbar.
The row is marked for deletion in the result grid.
- Click the  button to delete the data from the database.

5.1.6 Importing Data

Data contained in CSV files can be imported to a database. DatabaseSpy provides an import dialog box that allows you to preview the data before actually importing them and to choose whether the import is immediately executed or an SQL script should be generated which can be executed later.

Objective

In this section of the tutorial, you will learn how to import data to a database. Specifically you will learn how to do the following:

- Preview the import of a CSV file
- Generate the script necessary to carry out the import

You will not need to actually import the data, as the supplied database already contains it.

Commands used in this section

Import data to the database: This command is located in the **Tools** menu and is available as an icon in the Tools toolbar. Clicking this icon opens the **Import data to the database** dialog box.

Generating an Import Script

All the options needed for importing data to a database can be defined in the **Import data to the database** dialog box. In this dialog box, you can also choose between immediate import and generation of an SQL script. In this tutorial, we will generate an SQL script since the data in the supplied import file is already contained in the database.

To generate an import script:

1. If you are not connected, [connect](#) to the TutorialDB data source connection.
2. Select the menu option **Tools | Import data to the database...**, or click the **Import**  button in the Tools toolbar, or press **Ctrl+I**. The **Import data to the database** dialog box is displayed.
3. Click the **CSV** icon on the left side.
4. In the Source group box, enter the path to the source file Course.txt, which is located in

the tutorial folder, or click the  button to browse to the file.

5. In the Destination group box, choose the **Update existing tables** radio button.
6. In the Import Mode group box, choose the **Generate SQL in SQL Editor** radio button.
7. Click the **Apply Options** button in the Preview group box.
The Course data and column names are shown in the preview window.

8. Click the **Generate SQL** button.
A script to insert data is generated and a dialog box appears informing you about the success of the SQL generation.
9. Click **OK** to switch to the newly created SQL Editor window.
The SQL script contains an INSERT statement for each row that is to be inserted into the **Course** table.

```

1  INSERT INTO [Course] ( [id], [name], [descr],
    [deptid], [teacherid], [upperlimit] ) VALUES ( 0,
    'Chemistry 101', 'First year Chemistry', 0, 2, 70 );
2
3  INSERT INTO [Course] ( [id], [name], [descr],
    [deptid], [teacherid], [upperlimit] ) VALUES ( 1,
    'Algebra 101', 'First year Algebra', 1, 0, 65 );
4
5  INSERT INTO [Course] ( [id], [name], [descr],
    [deptid], [teacherid], [upperlimit] ) VALUES ( 2,
    'Biology 102', 'First year Biology', 0, 1, 70 );

```

5.1.7 Exporting Data

DatabaseSpy allows you to export your database data to several types of files. In this tutorial, we will look at how to export data to XML files.

Objective

In this section of the tutorial, you will learn how to export database data. Specifically, you will learn how to do the following:

- Select tables for export

- Preview data before exporting
- Export columns as attributes
- Change column names for the XML export file
- Export the complete edu database to XML files

Commands used in this section

Export database data: This command is located in the **Tools** menu and is available as an icon in the Tools toolbar. Clicking this icon opens the **Export database data** dialog box.

Exporting to XML

In this tutorial, you will export the entire edu tutorial database to XML files. In the **Export database data** dialog box, you can define the path for the XML files and preview the individual tables prior to actually exporting them. The Preview window also allows for a selection of the columns to be exported as well as for renaming the column header for the XML files.

To export the edu database:

1. If you are not connected, [connect](#) to the TutorialDB data source connection.
2. Select the menu option **Tools | Export database data...**, or click the **Export**  button in the Tools toolbar, or press **Ctrl+E**.
3. In the **Export data base data** dialog box, click the **XML** icon on the left side of the dialog box.
4. In the Source database group box, select the Data Source TutorialDB from the drop-down list, if it has not been automatically selected.

5. In the Source group box, choose the **Table** radio button.
6. Select the **Course**, **Department** and **Teachers** tables, by clicking the respective check boxes.
Alternatively, since you want to select all of the available tables, you can also click the **User Tables** check box. This will automatically select all user tables.

7. In the Destination group box, enter "edu_" in the **File Prefix** field.
8. Enter the path you want the XML files to be exported to.
9. Select the **Course** table in the Source group box and click the **Preview** button in the Preview group box. The contents of the **Course** table appear in the list box below.

10. To export the **descr** column as an attribute, click the icon next to the "descr" table header  until it changes to an equals sign .
11. To rename the **descr** column, double-click the text "descr" and change it to "Description", press **Enter** to confirm.
12. To exclude the **upperlimit** column from the export, click the scrollbar to scroll to the right, then click the icon next to the "upperlimit" table header until it changes to a  icon.
This column will not be exported.

Description	deptid	teacherid	upperlin
First year Chemisty	0	2	70
First year Algebra	1	0	65
First year Biology	0	1	70
First year Calculus	1	0	65
Second year calculus	0	0	40

13. Click the **Export** button.

Checking the results

Open the folder that you exported the XML files to. You will see three files: edu_Course.xml, edu_Department.xml, and edu_Teachers.xml.

Name	Size	Type	Date Modified
edu_Course.xml	2 KB	XML Document	2007-09-20 3:55 PM
edu_Department.xml	1 KB	XML Document	2007-09-20 3:55 PM
edu_Teachers.xml	1 KB	XML Document	2007-09-20 3:55 PM

Open the file edu_Course.xml. As can be seen in the file, "Description" appears in the file as an attribute of each row, and the column "upperlimit" was not exported.

```

10 <Row Description="First year Chemisty">
11   <id>0</id>
12   <name>Chemistry 101</name>
13   <deptid>0</deptid>
14   <teacherid>2</teacherid>
15 </Row>
16 <Row Description="First year Algebra">
17   <id>1</id>
18   <name>Algebra 101</name>
19   <deptid>1</deptid>
20   <teacherid>0</teacherid>
21 </Row>
22 <Row Description="First year Biology">
23   <id>2</id>
24   <name>Biology 102</name>
25   <deptid>0</deptid>
26   <teacherid>1</teacherid>
27 </Row>

```

5.2 DatabaseSpy Tutorial

This tutorial takes you through several tasks which provide an overview of how to use DatabaseSpy™ 2012 to its fullest.

The goal of this tutorial is to use DatabaseSpy to create a database that models a zoo. SQL scripts and other files are provided to help you complete this task. You will create the database from scratch, and then use scripts and text files (*.TXT) to populate it with data.

In this tutorial, you will learn how to:

- Use [project files](#) to manage the connections and SQL files relevant to your database project
- Use DatabaseSpy to [connect to a Microsoft SQL Server 2005 database](#)
- [Create and add tables](#) to a database using SQL as well as DatabaseSpy's Design Editor
- [Create relationships](#) between those tables
- [Add constraints](#) to the tables
- Add data to the database using [SQL scripts](#) as well as DatabaseSpy's [import](#) and [editing](#) functionality
- [Browse the database](#) using the Online Browser
- Generate SQL statements using features of the SQL Editor such as [generating statements based on existing objects](#), and [autocompletion](#)
- [Export data](#) to XML files
- [Compare two schemas](#) of a database
- [Compare your database data](#) with a backup database

Installation and configuration

This tutorial assumes that you have successfully installed DatabaseSpy on your computer and received a free evaluation key-code, or are a registered user of the product. The evaluation version of DatabaseSpy is fully functional but limited to a 30-day period. You can request a regular license from our secure web server or through any one of our resellers.

Tutorial example files

The following files are available in the \Altova\DatabaseSpy2012\DatabaseSpyExamples\Tutorial sub-folder of the [\(My\) Documents](#) folder and are used in the Tutorial:

- create_ZooDB_tables.sql
- create_ZooDB_relationships.sql
- tblAnimalTypes_data.sql
- animalType_queries.sql
- tblZookeepers.txt
- dbo.tblMedicalTreatments.xml
- ZooDB.mdb
- CreateTestSchema.sql

The following files are not used in the tutorial and are only included for reasons of completeness:

- tblAnimalBirths.txt
- tblAnimalFeed.txt
- tblAnimals.txt
- tblFeedingSchedules.txt
- tblFeedSuppliers.txt

- tblMedicalTreatments.txt
- tblVeterinarians.txt
- dbo.tblAnimalBirths.xml
- dbo.tblAnimalFeed.xml
- dbo.tblAnimals.xml
- dbo.tblFeedingSchedules.xml
- dbo.tblFeedSuppliers.xml
- dbo.tblVeterinarians.xml
- dbo.tblZookeepers.xml

5.2.1 Setting Up a Database Project

Project files organize everything you need in order to work on your database projects. You can store the following items in a project file:

- Database connections
- SQL scripts
- Design files
- Database Data Comparison files
- Database Schema Comparison files
- Favorite database objects

Objective

In this section of the tutorial, you will learn how to create a project in DatabaseSpy and connect to a database. Specifically, you will learn how to do the following:

- Create a new project and [add a data source connection](#)
- [Add SQL files](#)
- [Change the project name](#)
- [Define the project startup options](#)

Commands used in this section

Create a Database Connection: This command is located in the Standard toolbar and in the **File** menu. Click this command to open the **Add a Data Source** dialog box that allows you to connect to any database supported by DatabaseSpy.

Add files to the project: This command is located in the toolbar of the Project window. Click this command to open the **Open** dialog box where you can choose the files to be added to and stored with your database project.

Save Project: This command is located in the toolbar of the Project window; alternatively, you can also choose the menu option **File | Save Project As...** or press **Ctrl+S**. Click this command to save an existing project under its project name or to specify a name and path for a new project, respectively.

Options: This command is located in the **Tools** menu. Click this command to open the **Options** dialog box where you can define the project startup options.

Creating a Database

The first step in this tutorial is to create a database in Microsoft SQL 2005 so that the tables, relationships, and data for the zoo database can be added to it at a later stage.

You will need administrator rights to create a database from scratch, please contact your

database administrator if you do not have the respective rights.

The screenshot below shows the newly created database in MS SQL Server 2005.

Please consult the respective Microsoft SQL Server Management Studio help files if you need assistance when creating the database.

Connecting to the Database

The Connection Wizard in the **Add a Data Source** dialog box allows you to establish a connection to existing databases of the most commonly used database types, such as Microsoft Access, Microsoft SQL Server, Oracle, MySQL, IBM DB2, Sybase, and PostgreSQL.

To connect to a database:

1. Select the menu option **File | Create a Database Connection...** or press **Ctrl+Q**. The **Add a Data Source** dialog box appears.

2. Click the **Connection Wizard** button at the top left of the dialog if it is not already selected, and choose the `Microsoft SQL Server ( ADO )` radio button.
3. Click **Next**.
The configuration page of the Connection Wizard appears.

4. Select the database provider `Microsoft OLE DB Provider for SQL Server` from the combo box.
5. Click **Next**.
The Connection tab of the **Data Link Properties** dialog box appears.

6. Select or enter the name of the server you want to connect to, e.g., TS-SQL.
7. Choose the Use a specific user name and password radio button.
8. Enter the User name and Password.
9. Activate the Allow saving password check box.
10. Select the database you want to connect to from the drop-down list, e.g., ZooDB, and click **OK**.
11. In the **Set A Data Source Name** dialog box, set the connection name to "ZooDBConnect" and click **OK**.

The Project window now contains a connection called "ZooDBConnect" in the Data Sources folder.

Adding SQL Files

A database project in DatabaseSpy allows you to store SQL files together with the database connection in one project file so that you have all the files and connections you need at hand when you open a project in DatabaseSpy.

In this step, you will add the SQL scripts to the project that you will later use to create the tables for the zoo database and to query the zoo database.

To add the SQL files to the project file:

1. In the Project window, right-click the SQL folder and select **Add Files to Project...** from the context menu. The **Open** dialog appears.
2. Select the files to be added to the SQL folder from the tutorial directory:
 - animalType_queries.sql
 - create_ZooDB_relationships.sql
 - create_ZooDB_tables.sql
 - tblAnimalTypes_data.sql
3. Click the **Open** button. The SQL files appear in the SQL folder of the Project window.

Renaming and Saving the Project

If a project has not been saved yet, `New Project *` is displayed as a project title in the Project window. You can change the project title by saving the project under a descriptive name. DatabaseSpy uses the name of the project file and displays it as project title in the Project window.

In this step of the tutorial, we will change the title of the project to "ZooDBProject" and save the project.

To save the project:

1. Select the menu option **File | Save Project As....**
2. In the **Save As** dialog box, choose a path for the project and enter "ZooDBProject" as a file name.
3. Click **Save**.
The project is saved as ZooDBProject.qprj and the Project window displays ZooDBProject as project name.

Defining the Project Startup Options

In the General options, you can define that the last project be opened by default when DatabaseSpy is started. In this case, the **Add a Data Source** dialog box is suppressed and the project that was open when you last closed DatabaseSpy is opened automatically.

To activate the "Open last project on startup" setting:

1. Select the menu option **Tools | Options** and click **General**.
2. Activate the `Open last project on startup` check box, and click **OK** to confirm.

5.2.2 Adding Tables to the Database

In the previous section, you have [created a database project](#) and [added a connection](#) to a database to it. However, this database does not contain any tables yet. In DatabaseSpy, you can add tables with only a few mouse clicks.

Objective

In this section of the tutorial, you will learn how to use SQL scripts and the Design Editor to create the tables that make up the zoo database. Specifically, you will learn how to do the following:

- [Open and execute](#) an SQL file that is supplied in the tutorial folder
- [Add a table](#) using the Design Editor
- [Generate and modify](#) a CREATE statement
- [Create relationships](#) between the tables

Commands used in this section

Open: This command is located in the context menu that opens when you right-click an SQL file in the SQL folder of the Project window. Alternatively, you can also double-click the SQL file to open the SQL script in an SQL Editor window.

Save Project: This command is located in the toolbar of the Project window; alternatively, you can also choose the menu option **File | Save Project As...** or press **Ctrl+S**. Click this command to save an existing project under its project name or to specify a name and path for a new project, respectively.

Execute: This command is located in the toolbar of an SQL Editor window and in the **SQL Editor** menu. Click this command to execute the SQL in the SQL Editor window.

Refresh: This command is available in the Online Browser as a button, or as an option in the context menu that opens when you right-click a database. Use this command to refresh the database and display new or changed database objects in the Online Browser.

Show in new SQL Editor | Create: This command is located in the context menu that opens when you right-click a table in the Online Browser. Click this command to generate a CREATE statement based on the selected table in a new SQL Editor window.

Design Editor: This command is located in the Standard toolbar; alternatively, you can also choose the menu option **File | New | Design Editor** or press **Ctrl+D**. Click this command to open a new Design Editor window which is assigned to the active data source connection.

New Table: This command is located in the Design Editor toolbar; alternatively, you can also choose the menu option **Design Editor | Create New Table** or press **Ctrl+T**. Click this command to add a new table to an open Design Editor window.

Make Primary Key: This command is located in the context menu that appears when

you right-click a table in a table design. Click this command to define the primary key for the table.

Make Foreign Key: This command is located in the context menu that appears when you right-click a table in a table design. Click this command to define a new foreign key for the table.

Execute Change Script: This command is located in the toolbar of the Database Structure Change Script window. Click this command to execute the recorded change script and to commit the changes to the database.

Opening and Executing an SQL File

In the previous section of the tutorial, you [added the create_ZooDB_tables.sql script](#) to your database project. This script can now be used to add tables to the zoo database. Note that any SQL script must be assigned to a data source connection before it can be executed in DatabaseSpy. You can define the data source either in the Project window and save it together with the project options, or you can assign a data source in the SQL Editor window before you execute the script. In this step of the tutorial, you will choose the data source directly in the SQL Editor window.

To add tables to a database by executing an SQL script:

1. Make sure that the ZooDBConnect connection is active.
2. In the Project window, double-click the `create_ZooDB_tables.sql` entry in the SQL folder.
The script file opens in an SQL Editor window, however no connection to a data source has been established yet.

3. Click the *Offline* hyperlink to jump to the data source properties and choose "ZooDBConnect" from the Data Source drop-down list.

The SQL script is now connected to the ZooDBConnect data source, and the execution buttons in the SQL Editor are active.

4. Click the **Save Project**  button in the Project window or press **Ctrl+S** to save this data source assignment in the project properties.
5. In the SQL Editor, click the **Execute**  button or press **F5**. The tables are added to the ZooDB database.
6. To be able to see the newly added tables in the Online Browser, do the following:
 1. Click the **Online Browser** tab.
 2. Right-click on the name of the database, **ZooDB**, and select **Refresh** from the context menu or click the **Refresh**  button in the toolbar of the Online Browser.

The newly inserted tables are displayed in the User Tables folder. If the script executed successfully, the following tables will have been added to the database:

Adding Tables Using Design Editor

The Design Editor can also be used to add tables to databases using a graphical user interface. Use of the Design Editor requires no knowledge of SQL syntax.

We now want to add a table to the database that contains data about companies that supply animal feed to the zoo. We will call this table **tblFeedSuppliers**. This table should have the following columns:

- **SupplierID**: int; not null; primary key
- **SupplierName**: varchar(50); not null
- **SupplierAddress**: varchar(50); not null
- **SupplierCity**: varchar(50); not null
- **SupplierState**: varchar(50); not null
- **SupplierTelephone**: varchar(20); not null

To add a table called **tblFeedSuppliers** to the database using the Design Editor:

1. Click the **Design Editor**  button in the Standard toolbar.

A new Design window, called Design1, is opened with the connection name and database name visible in the Status bar.

2. Click the **New Table**  button. A new table appears in the Design Editor window.

A change script message appears at this point, and the SQL statements appear in the Database Structure Change Script window. Once the table definition has been completed, the change script needs to be executed to create the table.

3. Double-click the table name, table (dbo), and enter "tblFeedSuppliers". Press **Enter**.

4. Double-click on the text "id". Change the value to "SupplierID" and press **Enter**.

The table currently has one column, and we want to add five more.

5. Click the plus icon  next to column SupplierID. A column is added and selected for editing. Type "SupplierName" and press **Enter**.
6. Right-click into the table and choose **Insert new | Column** from the context menu. Change the column name to "SupplierAddress" and press **Enter**.
7. Press the keyboard shortcut **Alt+C**, enter "SupplierCity" as column name and press **Enter**.
8. Repeat any of steps 4 through 6 two more times for the columns "SupplierState" and "SupplierTelephone".
9. Double-click the "varchar(255)" entry in the Type column next to SupplierID, select the entry and enter "i". Note that a drop-down list appears with the available data types. Select "int" from the list and press **Enter**.
10. Double-click the "varchar(255)" entry in the Type column next to SupplierName and change the length from 255 to 50.
11. Repeat step 10 for the remaining columns; enter a length of 20 for SupplierTelephone. Deactivate the `Nullable` check box for all columns.

12. A primary key has already been created in the design when the table was created, and the column SupplierID has been automatically inserted in the Columns column.
13. Double-click the prefix "PK_", edit the key to "PK_Supplier", and press **Enter**.

14. Right-click the title bar of the Columns section and activate the **Identity** option in the context menu. Activate the `Identity` check box for `SupplierID` that appears in an additional column of the table design.

15. Optionally, display also the `Increment` and `Seed` column as described in the step above. These properties are both 1 by default and you do not have to change them.
16. The entire table definition is now listed in Database Structure Change Script window. Note that the table is still not included in the database, it currently exists only in the Design Editor.

17. In the Database Structure Change Script window, click the **Execute Change Script**  button to commit the new table to the database.

Generating and Editing a CREATE Statement

The Online Browser allows you to generate SQL statements based on an existing table or column. In this step, we will generate a CREATE statement from the table `tblZookeepers`, edit the statement, and use it to create a new table `tblVeterinarians`.

To add a table by editing a CREATE statement generated from an existing table:

1. In the Online Browser, right-click the `tblZookeepers` table.
2. Select the menu option **Show in new SQL Editor | Create** from the context menu. An SQL Editor window appears, displaying the following SQL statement:

```
1  CREATE TABLE [ZooDB].[dbo].[tblZookeepers] (
    [ZookID] int IDENTITY (1, 1) NOT NULL , [FirstName]
varchar (50) COLLATE SQL_Latin1_General_CP1_CI_AS
NOT NULL , [LastName] varchar (50) COLLATE
SQL_Latin1_General_CP1_CI_AS NOT NULL , [Address]
varchar (50) COLLATE SQL_Latin1_General_CP1_CI_AS
NOT NULL , [City] varchar (50) COLLATE
SQL_Latin1_General_CP1_CI_AS NOT NULL , [State]
varchar (50) COLLATE SQL_Latin1_General_CP1_CI_AS
NOT NULL , [Telephone] varchar (50) COLLATE
SQL_Latin1_General_CP1_CI_AS NOT NULL , [DOB]
datetime NOT NULL , CONSTRAINT [PK_Zook] PRIMARY KEY
CLUSTERED ( [ZookID] ) ) ;
```

3. Edit the statement as shown below to create **tblVeterinarians**. The parts of the statement that need to be changed are marked using *underlined, italic text*:

```
CREATE TABLE [ZooDB].[dbo].[tblVeterinarians] ( [VetID] int
IDENTITY (1, 1) NOT NULL , [FirstName] varchar (50) COLLATE
SQL_Latin1_General_CP1_CI_AS NOT NULL , [LastName] varchar (50)
COLLATE SQL_Latin1_General_CP1_CI_AS NOT NULL , [Address]
varchar (50) COLLATE SQL_Latin1_General_CP1_CI_AS NOT NULL ,
[City] varchar (50) COLLATE SQL_Latin1_General_CP1_CI_AS NOT
NULL , [State] varchar (50) COLLATE SQL_Latin1_General_CP1_CI_AS
NOT NULL , [Telephone] varchar (50) COLLATE
SQL_Latin1_General_CP1_CI_AS NOT NULL , [DOB] datetime NULL ,
CONSTRAINT [PK_Vet] PRIMARY KEY CLUSTERED ( [VetID] ) ) ;
```

4. Click the **Execute**  button or press **F5**.
5. In the Online Browser, right-click the `ZooDB` database and select **Refresh** from the context menu, or click the **Refresh**  button.
The newly inserted table, `tblVeterinarians`, is displayed along with the tables that you created earlier.

Creating Relationships Between the Tables

Now that you have added the tables to the zoo database, you will add the foreign key relationships to the database using both the Design Editor and an SQL script. A foreign key is a relation between two tables that ensures that data can only be inserted into certain columns in one table if it exists in the second table.

In our example, a new animal type in table `tblAnimalTypes` can only be added if the Category is existing as `CategoryID` in table `tblAnimalCategories`. This way, you can only add animals that belong to an animal category that is already defined in `tblAnimalCategories`. You will use the Design Editor to add this relation to the database. Furthermore, this tutorial provides an SQL script that adds the remaining foreign key relations to the database.

To define a foreign key relationship using the Design Editor:

1. Make sure that the ZooDBConnect connection is active and click the **Design Editor**  button in the Standard toolbar or press **Ctrl+D**.
2. In the Online Browser, click table `tblAnimalTypes` and drag it into the Design Editor window.
3. Right-click the table design and select **Insert new | Key | Foreign Key** from the context menu.
A foreign key is created in the design, the prefix "FK_" is inserted, and the entry is selected for editing.
4. Edit the key to "FK_CategoryID" and press **Enter**.
5. In the Reference column, double-click the "[select the referenced table]" entry, and select "`tblAnimalCategories`" from the drop-down list that appears. The first column "CategoryID" of the referenced table appears below the table name and there is no need to change this entry.
6. In the Columns column, double-click the "AnimalTypeID" entry that has been inserted by default, and select "Category" from the drop-down list that appears.

7. In the Database Structure Change Script window, click the **Execute Change Script**  button to execute the change script and to commit the new foreign key to the database.
8. Optionally, right click the "FK_CategoryID" entry in the table design and select **Add related tables | Referenced Tables** from the context menu.

Adding the remaining foreign key relationships via SQL

To speed up the creation of the remaining foreign key relationships for the zoo database, an SQL script is provided in the tutorial folder. This script has already been [added to the project](#)

earlier in this tutorial.

To add a foreign key relationship by executing an SQL script:

1. Make sure that the ZooDBConnect connection is active.
2. In the Project window, double-click the file `create_ZooDB_relationships.sql`. The file opens in an SQL Editor window.

3. In the General section of the Properties window, choose "ZooDBConnect" from the Data Source drop-down list.

The SQL script is now connected to the ZooDBConnect data source, and the execution buttons in the SQL Editor become active.

4. Click the **Save Project**  button in the Project window or press **Ctrl+S** to save this data source assignment in the project properties.
 5. Click the **Execute**  button or press **F5**. Foreign key relationships are created between the tables in the zoo database.
- Using the Design Editor, you can get a graphical view of the relationships that were just created.

5.2.3 Defining Constraints

In the previous section, you have [added tables](#) and [created relations](#) between them. You may want to control which data is added to your database tables, or simplify data entry by defining default values for certain columns.

Objective

In this section of the tutorial, you will learn how to use the Design Editor to create columns that can contain only unique or limited data, or have a predefined standard value. Specifically, you will learn how to do the following:

- Define a [unique constraint](#) for a column
- Add [check constraints](#) on column and table level
- Provide columns with [default values](#)

Commands used in this section

Show in new Design Editor: This command is located in the context menu that opens when you right-click a database object in the Online Browser. Click this command to open a new Design Editor window and display the selected database object in it.

Make Unique Key: This command is located in the context menu that opens when you

right-click a column in a table design. Click this command to define a unique key on the selected column.

Execute Change Script: This command is located in the toolbar of the Database Structure Change Script window. Click this command to execute the recorded change script and to commit the changes to the database.

Insert new | Check Constraint: This command is located in the context menu that opens when you right-click somewhere into a table design. Click this command to define a new check constraint for the table.

Create Default Constraint: This command is located in the context menu that opens when you right-click a column in a table design. Click this command to define a default constraint for the selected column.

Edit Data: This command is located in the **SQL and Data** sub-menu of the context menu that opens when right-clicking a table design. Choose this command to generate an SQL SELECT statement that is automatically executed in the SQL Editor and switches the Result window into the Editing mode. This command works for all supported database kinds for both ADO and ODBC connections.

Options...: This command is located in the **Tools** menu. Click this command to display the **Options** dialog box, where you can change the DatabaseSpy settings.

Append a new row: This command is available as a button in the Result window toolbar. Click this button to add a new row to the result grid. Alternatively, you can also right-click anywhere in the result grid and choose **Append a new row** from the context menu. The **Append a new row** command is only available if the Result window is in the Editing mode.

Defining a Unique Key

By defining a unique key, you can prevent the user from entering duplicate data into a column. In our zoo database, you will define a unique key on the LatinName column of table tblAnimalTypes. This way, each name can be added to the table only once.

To define a unique key on a column:

1. In the Online Browser, right-click table tblAnimalTypes and select **Design Editor | Show in new Design Editor** from the context menu.
2. In the table design, right-click column LatinName and select **Make Unique key** from the context menu.

A unique key is created in the design, the prefix "UK_" is inserted, and the entry is selected for editing.

3. Edit the key to "UK_LatinName" and press **Enter**.

4. In the Database Structure Change Script window, click the **Execute Change Script** button to execute the change script and to commit the new unique key to the database.

Defining a Check Constraint

When a check constraint is defined, data will be validated according to the expression specified in the check constraint, before it is added to a table. Data that fails the validation will not be added.

In this section of the tutorial, you will create a check constraint that makes sure that different animals are entered into the Mother and Father columns of tblAnimalBirths. Since this constraint spans more than one column, it will be displayed in the Check Constraints section of the table design, and in the Constraints sub-folder of the Online Browser, respectively.

To define a check constraint:

1. In the Online Browser, right-click table tblAnimalBirths and select **Design Editor** |

Show in new Design Editor from the context menu.

2. Right-click the table design and select **Insert new | Check Constraint** from the context menu.

A check constraint is created in the design, the prefix "CK_" is inserted, and the entry is selected for editing.

3. Edit the key to "CK_CheckParents" and press **Enter**.
4. In the Expression column, double-click the "[expression required]" entry, enter "Mother <> Father", and press **Enter**.
5. In the Database Structure Change Script window, click the **Execute Change Script**  button to execute the change script and to commit the new check constraint to the database.

Testing the check constraint

After the check constraint has been committed to the database, you cannot enter the same animal ID into the Mother and Father columns anymore. If both columns contain the same value in a row, DatabaseSpy displays an error in the Message tab.

Defining a Default Constraint

For some columns it may be useful to define a standard value. By defining a default constraint and setting the Result view options accordingly, this default is inserted automatically when a new row is added to the table in the Result view.

In this section of the tutorial, you will define a default constraint on the tblAnimalBirths table which sets the number in litter automatically to "1" for new rows that are added in the Result view.

To set a default number in litter in tblAnimalBirths:

1. In the table design, right-click column NumberInLitter and select **Create Default Constraint** from the context menu. The Default Value column appears in the table design. (If the Default Value column is not visible, click into the table design and it will resize properly.)

2. Double-click the field in the NumberInLitter row, type "1", and press **Enter**.
3. In the Database Structure Change Script window, click the **Execute Change Script**  button to execute the change script and to commit the new default constraint to the database.

Testing the default constraint

When testing the default constraint you have just defined, make sure that the `Initialize cells with default values` option is enabled in the [Result View](#) options. Please note that this option is disabled by default.

To create a new row containing a default value:

1. Select the menu option **Tools | Options (Ctrl+Alt+O)** and select the Result View page of the **Options** dialog box.
2. Activate the `Initialize cells with default values` check box and click **OK**.
3. Right-click the table heading in the Design Editor and select **SQL and Data | Edit Data** from the context menu. A message box appears, click **OK**.
4. In the Result view, click the **Append a new row**  button.

The NumberInLitter column shows "1" in the new row.

	BirthID	BirthDate	Mother	Father	Veterinarian	NumberInLitter
1			{NULL}	{NULL}	{NULL}	1

5.2.4 Inserting Data into the Database

To insert data into the database, you can enter individual INSERT statements into an SQL Editor window or save them in an SQL file and execute all the statements together. More conveniently, DatabaseSpy also allows you to import data from TXT files and add new records in the Result window after executing a SELECT statement for editing.

Objective

In this section of the tutorial, you will learn how to insert data into the [tables you have created in the previous section](#). Specifically, you will learn how to do the following:

- [Execute an SQL script](#) that populates the zoo database with data
- Import data provided in a [TXT](#) file
- Import data provided in an [XML](#) file
- [Create a new SQL script](#) and save it in the project
- [Add new records in the Result window](#) of the SQL Editor

Commands used in this section

Execute SQL: This command is located in the context menu that opens when you right-click an SQL file in the SQL folder of the Properties window. Use this command to immediately execute the SQL statements contained in the file.

Row Count | Show/Update: This command is available in the context menu that opens when you right-click a table, view or its parent folder in the Online Browser. Click this command to display the number of rows for the selected table or view, or the number of rows for all tables or views, respectively, that are contained in the selected folder.

Import: This command is located in the Tools toolbar; alternatively, you can also choose the menu option **Tools | Import data to the database...** or press **Ctrl+I**. Click this command to open the **Import data to the database** dialog box.

Execute: This command is located in the toolbar of an SQL Editor window and in the **SQL Editor** menu. Click this command to execute the SQL in the SQL Editor window.

Retrieve data | All rows: This command is located in the context menu that opens when you right-click a table or column in the Online Browser; alternatively, you can also select the table and press **Ctrl+Alt+R**. Click this command to have all rows of data displayed in a Result tab.

SQL Editor: This command is located in the Standard toolbar; alternatively, you can also choose the menu option **File | New | SQL Editor** or press **Ctrl+N**. Click this command to open a new SQL Editor window that is assigned to the active data source connection.

Save: This command is located in the Standard toolbar; alternatively, you can also choose the menu option **File | Save** or press **Ctrl+S**. Click this command to save the active file.

Add the Active File: This command is located in the toolbar of the Project window. Clicking this command adds the active file to the project under its corresponding folder.

Save Project: This command is located in the toolbar of the Project window; alternatively, you can also choose the menu option **File | Save Project As...** or press **Ctrl+S**. Click this command to save an existing project under its project name or to specify a name and path for a new project, respectively.

Edit Data: This command is located in the context menu that opens when you right-click a table or column in the Online Browser; alternatively, you can also select the table and press **Ctrl+Alt+E**. Choose this command to generate an SQL SELECT statement that is automatically executed in the SQL Editor and switches the Result window into the Editing mode. This command works for all supported database kinds for both ADO and ODBC connections.

Append a new row: This command is available as a button in the Result window toolbar. Click this button to add a new row to the result grid. Alternatively, you can also right-click anywhere in the result grid and choose **Append a new row** from the context menu. The **Append a new row** command is only available if the Result window is in the Editing mode.

Commit

: This command is available as a button in the Result window toolbar. Click this button to commit the changes you have made in the result grid to the database. The **Commit** button is only visible if the Result window is in the Editing mode.

Using a Script to Add Data to the Database

Earlier in this tutorial, you [added a script to the ZooDBProject](#) that you can now use to populate the `tblAnimalTypes` and `tblAnimalCategories` tables with data. The file `tblAnimalTypes_data.sql` contains all the INSERT statements that are necessary to add the data to the `tblAnimalTypes` and `tblAnimalCategories` tables.

```

1  USE zooDB
2
3  INSERT INTO tblAnimalCategories (Category)
  VALUES ('marsupial')
4
5  DECLARE @CategoryID As int
6
7  SET @CategoryID = (SELECT CategoryID FROM
  tblAnimalCategories WHERE Category =
  'marsupial')
8
9  INSERT INTO tblAnimalTypes (EnglishName,
  LatinName, AreaOfOrigin, Category)
10 VALUES ('Parma wallaby', 'Macropus parma',
  'Australia', @CategoryID)
11
12 INSERT INTO tblAnimalCategories (Category)
13 VALUES ('bonytongue')
```

To avoid the manual data source assignment to the individual SQL files in your project in the future, you will also define a default data source (i.e., your tutorial database) for all files that are contained in the SQL folder of the Project window.

To set a default data source for the SQL folder:

1. Click the SQL folder in the Project window.
2. In the Properties window below, select "ZooDBConnect" from the Data Source drop-down list in the General section.

3. Click the `tblAnimalTypes_data.sql` file in the SQL folder and note that "ZooDBConnect" now appears as data source in the properties.

To execute tblAnimalTypes_data.sql:

1. Make sure that the ZooDBConnect connection is active.
2. In the Project window, right-click the file tblAnimalTypes_data.sql in the SQL folder and choose **Execute SQL**  from the context menu.

The file opens in an SQL Editor window and executes automatically. The tables `tblAnimalTypes` and `tblAnimalCategories` are populated with data.

Checking the result

To do a quick check as to whether the tables have been successfully populated with data, you can display the row count for all tables in the Online Browser.

To display the row count of all tables in the Online Browser:

- Right-click the User Tables folder and select **Row Count | Show/Update** from the context menu.

Importing Data from TXT Files

DatabaseSpy provides an import function which allows you to insert data provided in TXT files into a database. Example TXT files for the zoo database are included in the tutorial folder of your DatabaseSpy installation. How to [import data from XML files](#) will be explained in the next step of this tutorial.

In this step, you will import data from TXT files to the zoo database. You would have to follow the sequence for all supplied TXT files, if you want to import all the Zoo table data. In this case, adhere to the following sequence in order to avoid problems with foreign key relationships:

1. `tblZookeepers.txt`
2. `tblFeedSuppliers.txt`
3. `tblAnimalFeed.txt`
4. `tblFeedingSchedules.txt`

5. tblAnimals.txt
6. tblVeterinarians.txt
7. tblAnimalBirths.txt

To import data from TXT files to the zoo database:

1. Click the **Import**  button in the Tools toolbar, or select the menu option **Tools | Import data to the database...**, or press **Ctrl+I**.
The **Import data to the database** dialog box opens.

2. Click the **CSV** icon on the left side.
3. In the Selection tab, click  next to the Path field. Select tblZookeepers.txt from the \Altova\DatabaseSpy2012\DatabaseSpyExamples\Tutorial sub-folder of the [\(My\) Documents](#) folder.
The Data Source, Database, and Schema fields are filled automatically for you as you are still connected to the database.
4. Select the **Update existing tables** radio button.
5. Click the Import Mode you want to use, **Generate SQL in SQL Editor** in this example.
6. In the Preview group box, click the **Apply Options** button.
This displays table data in the Preview window. To view the table definition, choose the **Show Definition** radio button.

7. Optionally, click inside the **Target Table Name** column to change the target table name.
8. Click the **ZookID** table icon  until it changes to the symbol for a column not to be imported .
The column header allows you to define the fields key type, and also if it should be included during the import process. We will not import the ZookID column since this is an identity column and the primary key will be generated automatically during import.
9. Click the **Generate SQL** button.
This creates an SQL script which can be executed to complete the import process. Click **OK** in the message box to view the script in the SQL Editor.
10. Click the **Execute**  button or press **F5**.
11. In the Online Browser, right-click the **zooDB** database and select **Refresh** from the context menu.
12. Right click the **tblZookeepers** table and select **Retrieve data | All rows** from the context menu or press **Ctrl+Alt+R**.

Importing Data from XML Files

In the previous lesson, you learned how to insert data into a database [using text files](#). In DatabaseSpy, you can also use XML files to export data from, or import data into, a database. The tutorial folder of your DatabaseSpy installation includes also example XML files for this

purpose.

In this step, you will use `dbo.tblMedicalTreatments.xml` to import data from an XML file to the zoo database. You would have to import all other TXT or XML files first in order to avoid problems with foreign key relationships.

To import data from XML files to the zoo database:

1. Click the **Import**  button in the Tools toolbar, or select the menu option **Tools | Import data to the database...**, or press **Ctrl+I**.
The **Import data to the database** dialog box opens.

2. Click the **XML** icon on the left side.
3. In the Selection tab, click  next to the Path field. Select `dbo.tblMedicalTreatments.xml` from the `\Altova\DatabaseSpy2012\DatabaseSpyExamples\Tutorial` sub-folder of the [\(My\) Documents](#) folder.
The Data Source, Database, and Schema fields are filled automatically for you as you are still connected to the database.
4. Select the `Update existing tables` radio button.
5. Click the Import Mode you want to use, `Generate SQL in SQL Editor` in this example.
6. Click the Options tab to display the import options for XML files.
7. In the Start point of import group box, choose the `Starting from` radio button and select "Row" from the drop-down list.

8. In the Automatic fields group box, deactivate the `Create primary/foreign keys` check box.
9. Choose the `Exclude namespace name` radio button in the Other options group box.
10. In the Preview group box, click the **Apply Options** button.
This displays table data in the Preview window. Note that the `Import` element now is not an available choice anymore. To view the table definition, choose the `Show Definition` radio button.

11. Click inside the `Target Table Name` column and choose "`dbo.tblMedicalTreatments`" from the drop-down list.
12. Click the `TreatmentID` table icon  until it changes to the symbol for a column not to be imported .
The column header allows you to define whether it should be included during the import process. We will not import the `TreatmentID` column since this is an identity column and the primary key will be generated automatically during import.
13. Choose the `Show Definition` radio button and click into the "varchar" field of column `TreatmentDate`. Change the data type to "datetime".

14. Change the data types of columns `AnimalID` and `VetID` to "int".

15. Click the **Generate SQL** button.
This creates an SQL script which can be executed to complete the import process.
Click **OK** in the message box to view the script in the SQL Editor.
16. Click the **Execute**  button or press **F5**.
17. In the Online Browser, right-click the `zooDB` database and select **Refresh** from the context menu.
18. Right click the `tblMedicalTreatments` table and select **Retrieve data | All rows** from the context menu or press **Ctrl+Alt+R**.

	TreatmentID	TreatmentDate	AnimalID	Problem	VetID
1	1	2006-01-09 00:00:00.000	5000	Heartworms	1
2	2	2005-02-28 00:00:00.000	5001	Equine Infectious ...	4
3	3	2005-12-13 00:00:00.000	5003	Erysipelas	6
4	4	2005-06-17 00:00:00.000	5004	Newcastle Disease	2

Execution was successful. Rows: 8, Cols: 5 0.718 sec 11:39:39

Creating and Saving an INSERT Script

The context menu that opens when you right-click a table and drag it into an SQL Editor window provides the possibility to generate an INSERT statement based on an existing table.

Assuming that the zoo in our tutorial has just hired two new zookeepers, you will create a script that adds these two new employees to the table `tblZookeepers`, and save that script in your project.

To create a script that inserts two new zookeepers into `tblZookeepers`:

1. Click the **SQL Editor**  icon in the Standard toolbar or select the menu option **File | New | SQL Editor (Ctrl+N)** to open a new SQL Editor window.
2. Using the **right** mouse button, drag and drop the `tblZookeepers` table from the Online Browser into the SQL Editor window.
A context-sensitive menu appears.
3. Select **Insert** from the context menu.

The following statement appears in the SQL window:

```
INSERT INTO [ZooDB].[dbo].[tblZookeepers] ( [ZookID],
[FirstName], [LastName], [Address], [City], [State],
[Telephone], [DOB] ) VALUES ( , '', '', '', '', '', '' );
```

4. Repeat steps 2 and 3 to create a second INSERT statement.

5. Alter the **first INSERT statement** as follows:

```
INSERT INTO [ZooDB].[dbo].[tblZookeepers] ([FirstName],
[LastName], [Address], [City], [State], [Telephone], [DOB] )
VALUES ('June', 'Bug', '1345 Gorilla Highway', 'Newark', 'NJ',
' ( 515) 555-7217' , '1963-11-26' );
```

Please note: No value is being inserted for the column ZookID, because it is an identity column and its value will be automatically generated. You must therefore delete the [ZookID] entry and the first comma from the statement.

6. Alter the **second INSERT statement** to add the following values:

```
INSERT INTO [ZooDB].[dbo].[tblZookeepers] ([FirstName],
[LastName], [Address], [City], [State], [Telephone], [DOB] )
VALUES ('Bruno', 'Katz', '87 Panther Place', 'Trenton', 'NJ',
' ( 515) 555-7667' , '1969-09-13' );
```

7. Click the **Execute**  button or press **F5**.
8. To check the results, open a new SQL Editor window and enter the statement **SELECT**
*** FROM tblZookeepers**. Execute the statement. Optionally, click the **Maximize**  button to extend the size of the Result window. Notice that two new rows have been inserted into the table.

	ZookID	FirstName	LastName	Address	City	State	Telephone
13	13	Sally	Crowe	42 Platypus Drive	Camden	NJ	(515)555-
14	14	June	Bug	1345 Gorilla Highway	Newark	NJ	(515)555-
15	15	Bruno	Katz	87 Panther Place	Trenton	NJ	(515)555-

Execution was successful. Rows: 15, Cols: 8 0.562 sec 12:19:07

To save the SQL script and add it to the project:

1. Make the SQL Editor window that contains the INSERT statements the active window and click the **Save**  button in the Standard toolbar. The **Save As** dialog box opens.
2. Enter a name for the script, e.g., New_keepers (.sql), select a folder and click the **Save** button. The **Add to Project** dialog box opens (if the dialog box does not pop up, check whether the `Do not show dialog` option is checked in the Newly saved files group box of the General options).

3. Click the **Add to Project** button.
Alternatively, or if the **Add to Project** dialog box is not displayed, you can also click the **Skip Project** button and do one of the following:
 - Click the Project tab, right-click the SQL folder, and select **Add Active File to Project** from the context menu.
 - Click the **Add the Active File**  icon in the toolbar of the Project window.

- Right-click the name tab in the SQL Editor and select **Add to Project** from the context menu that opens.

4. Right-click the project's title, **ZooDBProject**, and select **Save Project** from the context menu, or click the **Save Project** icon in the toolbar of the Project window.

Adding Data in the Result Window

A more convenient way to insert data into the database is to add data directly in the Result window.

	SupplierID	SupplierName	SupplierAddress	SupplierCity	SupplierState	SupplierTelephone
7	7	The Pampered Pet	245 Greenaway Street	Chicago	IL	(515)555-0706
8	8	ZooChow Central	3130 Ninth Avenue	NY	NY	(515)555-3345
9		Food4Animals	67 Ella Drive	Boston	MA	(515)555-8647

Note that the Result window has to be enabled for data editing before you can add or delete rows or edit the data displayed in the result grid. For this purpose, the **Edit Data** command is available in the context menu that opens when you right-click a table or column in the Online Browser.

To add a new food supplier in the Result window:

1. In the Online Browser, right-click the **tblFeedSuppliers** table and select **Edit Data**

from the context menu; alternatively, select the table and press **Ctrl+Alt+E**.

DatabaseSpy generates a SELECT statement in a new SQL Editor window, automatically executes it, and enables the Result window for editing.

2. A popup appears, informing you that editing of data is limited for this table.

3. Click the **Show Details** button to learn which columns cannot be edited.

4. Optionally, if you want to suppress this popup in the future, click the **Don't show this dialog again!** check box.
5. Click **OK** to close the popup and display the data in the Result window.
6. In the Result window, click the **Append a new row**  icon.

	SupplierID	SupplierName	SupplierAddress	SupplierCity	SupplierState
8	8	ZooChow Central	3130 Ninth Avenue	NY	NY
9					

Please note that the cursor automatically appears in the `SupplierName` column because the value for the `SupplierID` column will be generated automatically when the data is committed to the database.

7. Enter the following data into the newly created row:

Food4Animals | 67 Ella Drive | Boston | MA | (515) 555-8647

8. Click the  button to save the changes to the database.
9. Optionally, click the [\(8\) update](#) hyperlink next to `tblFeedSuppliers` in the Online Browser to update the row count of the table.

5.2.5 Browsing the Database

Now that you [populated the tables of the zoo database](#) with data in the previous section of the tutorial, you may want to browse the database and find individual database objects. DatabaseSpy allows you to customize the view of the Online Browser, use filters, and provides the Object Locator if you need to locate a specific object in the database.

Objective

In this section of the tutorial, you will learn how to use filters and how to locate objects in your database project. Specifically, you will learn how to do the following:

- [Customize the Online Browser](#)
- [Show the row count](#) of tables and views
- [Filter database objects](#) in the Online Browser
- Use the Object Locator to [locate a specific database object](#)

Commands used in this section

Folders: This command is located in the toolbar of the Online Browser. Click the arrow to the right of the icon to open the drop-down list from where you can select a folder layout for the Online Browser. Please note that the icon changes in accordance with the selected layout.

Row Count | Show/Update: This command is available in the context menu that opens when you right-click a table, view or its parent folder in the Online Browser. Click this command to display the number of rows for the selected table or view, or the number of rows for all tables or views, respectively, that are contained in the selected folder.

Row Count | Clear: This command is available in the context menu that opens when you right-click a table, view or its parent folder in the Online Browser. Click this command to hide the row count for the selected table or view, or for all tables or views, respectively, that are contained in the selected folder.

Filter folder contents: This command is located in the toolbar of the Online Browser. Clicking this command displays additional filter icons to the right of the folders and allows you to enter filter criteria. The display changes dynamically as you enter the criteria.

Object Locator: This command is located in the toolbar of the Online Browser. Click this command to display a text box and a drop-down list below the Online Browser.

Search within/all: This command is located to the right of the drop-down list that appears if the Object Locator is switched on. Click this command to define the focus for the Object Locator. Please note that the icon changes in accordance with the selected focus.

Customizing the Online Browser

The Online Browser window can be configured to show different aspects of the current database. Click the Layouts  icon in the icon bar of the Online Browser and select the specific layout you want to use from the drop-down list that opens. The default layout in the Online Browser is **Folders** . Please note that the icon changes in accordance with the selected layout.

Please note: Filters cannot be defined when either the **No Folders** or the **Table Dependencies** layout is active.

Showing the Row Count

You can get an overview on the number of rows in a table or view without the need to retrieve data first. The row count is displayed directly in the Online Browser and can be updated or cleared at any time, either for single tables or views, respectively, or for all objects in a folder at once.

The row count can be disabled in the [Online Browser options](#); it is enabled by default.

To show the row count for a single table:

1. Make sure that the **Optional display of Table and View row counts** check box is activated in the Online Browser options (select the menu option **Tools | Options** or press **Ctrl+Alt+O** and select the Online Browser page to check).
2. If you hover over tables or views in the Online Browser, the string "(count)" is displayed to the right of any table or view. Select **tblAnimals** and click on "(count)". Notice how the

string turns into a link when you place the mouse cursor over it.

Alternatively, you can also right-click **tblAnimals** and select **Row Count | Show/Update** from the context menu.

To show the row count for all objects of a folder:

- With the row counts option activated, right-click the **User Tables** folder in the Online Browser and select **Row Count | Show/Update** from the context menu.

The number of rows is retrieved for all tables that are contained in the **User Tables** folder.

To hide the row count for tables, views, or folders:

- Select the database object for which you do not want to show the row count, right-click and select **Row Count | Clear** from the context menu.

Filtering Objects

The application of filters allows you to reduce the number of displayed database objects and thus show only those objects that meet certain filter criteria. You can define different filters for each of the individual folders in the Online Browser.

Please note: Since the filters work on folder level, the filter function is not available in the **No Folders** and **Table Dependencies** layouts.

In this tutorial, you will use a filter to display only tables that contain the string "Animal" in the table name.

To filter for tables containing the string "Animal" in the table name:

- Make sure you are in **Folders** layout, and expand the folders so you can see the zoo database tables.
- In the Online Browser, click the **Filter folder contents**  icon in the toolbar or press **Ctrl+Alt+F**.
Filter icons appear next to the Schemas, Tables and Views folders.

- Click the Filter icon next to the Tables folder and select **Contains** from the menu that pops up.

A text field appears to the right of the filter icon.

- Enter "Animal" in the text field. The objects are filtered as you type.

Locating Database Objects

The Object Locator in DatabaseSpy serves for searching for a specific database object by name. When the Object Locator is turned on, you can enter a string in the text box below the Online Browser window and then select a database object from the drop-down list displaying only objects that contain the text entered in the text box. Clicking an entry in the drop-down list selects the corresponding database object in the Online Browser.

Note: To speed up the display of database objects in the Object Locator, only items are displayed that have already been loaded into the Online Browser in the current session. Therefore, if only a few items are displayed or a certain type of database items (e.g., keys or constraints) is missing at all, load these items into the Online Browser by expanding the tree until the desired object is visible. Use the **Expand | Siblings** and **Expand | Children** commands from the context menu for this purpose.

To display each and every item in the Online Browser:

1. In the Online Browser, expand the schema so that all its subfolders are displayed.
2. Use **Shift+Click** to select all sub-items of the schema.
3. Right-click and select **Expand | Children** from the context menu.
4. Repeat steps 2 and 3 until all subfolders of the schema are expanded.
Note that in large databases the loading of the items may take a considerable amount of time.

To locate database objects in the Online Browser

1. In the Online Browser, click the **Object Locator**  icon.
A text box and a drop-down list appear at the bottom of the Online Browser.
2. Enter the string you want to look for, e.g., "type".
Clicking the drop-down arrow displays all elements that contain that string.

3. Choose an object from the drop-down list to have it selected in the Online Browser.
4. Change the Object Locator context by clicking the arrow icon next to the drop-down list and select one of the options **From current Data Source**, **From focused item**, or **All**.

5.2.6 Querying the Database

From time to time, you will want to query your database to see which data is stored in the individual tables. DatabaseSpy provides several possibilities for doing this.

Objective

In this section of the tutorial, you will learn how to query the database. Specifically, you will learn how to do the following:

- [Query the zoo database](#) using multiple queries in a script
- [Create queries](#) using drag and drop

Commands used in this section

Execute: This command is located in the toolbar of an SQL Editor window and in the **SQL Editor** menu. Click this command to execute the SQL in the SQL Editor window.

Define Target Name: This command is located in the **SQL Script** toolbar and in the **SQL Editor** menu. Clicking this command will insert a comment defining a name for the Result tab before the statement in which the cursor is currently located.

Current statement: This command is located in the toolbar of an SQL Editor window. Click this command to select the statement in which the cursor is currently located.

Using a Script to Query the Database

The SQL file `animalType_query.sql` that you have [added to your database project](#) in one of the previous sections of this tutorial contains a script that uses targets to output the two queries it is composed of to two separate Result tabs and assign a name to each tab. This way, you can execute the script with a single mouse click and have the results displayed in different Result windows.

Targets can be defined by clicking on the **Define Target Name**  icon in the SQL Script toolbar and then editing the default target text inserted in the SQL window. Please see the [Working with SQL Scripts](#) section for more information.

To query the database using the script `animalType_queries.sql`:

1. Make sure that the ZooDBConnect connection is active.
2. Click the Project tab.
3. In the SQL folder, double-click the file `animalType_queries.sql`. The file opens in an SQL Editor window.

```
1  -- target: AnimalTypeCountQuery
2  SELECT COUNT (ZooDB.dbo.tblAnimalTypes.EnglishName)
3  FROM ZooDB.dbo.tblAnimalTypes, ZooDB.dbo.
   tblAnimalCategories
4  WHERE ZooDB.dbo.tblAnimalTypes.Category=ZooDB.dbo.
   tblAnimalCategories.CategoryID AND
5  ZooDB.dbo.tblAnimalCategories.Category='perch-like';
6
7  -- target: AnimalNameQuery
8  SELECT EnglishName, LatinName
9  FROM ZooDB.dbo.tblAnimalTypes
```

4. In the Properties window, make sure that either "Semicolons" or "SQL Grammar" is selected in the Group statements for execution with drop-down list.

- Click the **Execute**  button or press **F5**.
The results of the two queries appear in separate tabbed windows that use the corresponding target names as tab text.

If you do not get separate named result tabs as depicted above, deactivate the **Show multiple results stacked**  button in the SQL Editor toolbar.

Using Drag and Drop to Create Queries

DatabaseSpy allows you to generate SELECT statements by dragging a table and dropping it into an SQL Editor window. To this aim, you should make sure that the default statement generated for tables is a SELECT statement. Select the menu option **Tools | Options**, go to the **Online Browser** page and choose **Select** as SQL action for tables.

To generate a query based on the table tblZookeepers and specify a target for it:

1. Click the Online Browser tab.
2. Drag and drop the table `tblZookeepers` to the same SQL Editor window where the file `animalType_queries.sql` is currently open. This generates the following SELECT statement:

```
SELECT [ZookID], [FirstName], [LastName], [Address], [City],
[State], [Telephone], [DOB] FROM [ZooDB].[dbo].[tblZookeepers];
```
3. Place the cursor anywhere in the new SELECT statement. Click the **Current statement**  icon in the SQL Editor window. This selects the entire statement.
4. Click the **Define Target name**  button in the SQL Script toolbar. The text `-- target: Result` appears above the statement.

```
-- target: Result
SELECT [ZookID], [FirstName], [LastName], [Address],
[City], [State], [Telephone], [DOB] FROM
[ZooDB].[dbo].[tblZookeepers];
```

5. Change the text "Result" to "Select zookeepers".

```
-- target: Select zookeepers
SELECT [ZookID], [FirstName], [LastName], [Address],
[City], [State], [Telephone], [DOB] FROM [ZooDB].
[dbo].[tblZookeepers];
```

6. In the Properties window, make sure that either "Semicolons" or "SQL Grammar" is selected in the Group statements for execution with drop-down list.
7. Click the **Execute**  button or press **F5**.
The results of all three queries in the script appear in separate result windows.

Select zookeepers

	ZookID	FirstName	LastName	Address	City	State	Telephone
1	1	Annette	Bearhug	451 Capybara Lane	Newark	NJ	(515)555-7
2	2	Bob	Barker	68 Cage Boulevard	Philadelphia	PA	(515)555-1
3	3	Oliver	Birdsong	987 Flamingo Avenue	Harrisburg	PA	(515)555-E
4	4	Jenny	Lionheart	276 Cheetah Street	Sayre	PA	(515)555-2

Execution was successful. Rows: 15, Cols: 8 0.188 sec 13:48:09

Message | AnimalTypeCountQuery | AnimalNameQuery | Select zookeepers

Please note: When executing only one of the select statements, make sure that the `--target:` text is selected in addition to the select statement below it, if you want the target window text to be generated. The **Current statement** button will **not** select the `--target:` line!

5.2.7 Using Autocompletion

In DatabaseSpy, the autocompletion feature assists you when entering SQL statements in the SQL Editor. As you type, you are offered different possible SQL keywords or names of database objects to choose from.

The SQL syntax depends on the specific SQL flavor you are using. This is automatically determined by the connection string you defined using the Connection wizard, i.e., the Create a Database Connection option.

Objective

In this section of the tutorial you will learn how to use the autocompletion feature in DatabaseSpy. Specifically, you will learn how to do the following:

- Add a new column to the table `tblVeterinarians` using autocompletion to create an ALTER statement

Command used in this section

SQL Editor: This command is located in the Standard toolbar; alternatively, you can also choose the menu option **File | New | SQL Editor** or press **Ctrl+N**. Click this command to open a new SQL Editor window that is assigned to the active data source connection.

Refresh: This command is available in the Online Browser as a button, or as an option in the context menu that opens when you right-click a database. Use this command to refresh the database and display new or changed database objects in the Online Browser.

Execute: This command is located in the toolbar of an SQL Editor window and in the **SQL Editor** menu. Click this command to execute the SQL in the SQL Editor window.

Adding a New Column to a Table

In the list of veterinarians of our tutorial zoo, currently the only contact information is the phone number, so the zoo authorities also want the e-mail address of the veterinarian. You will add a column, called "Email" of type `varchar(50)`, to the table `tblVeterinarians`.

To create and execute an SQL ALTER statement using autocompletion:

1. Click the **SQL Editor**  icon to open a new SQL Editor window.
2. Enter "a". The autocompletion window pops up, click "ALTER", type "I" to reduce the suggested entries, and press the **Space** bar or select the keyword with the arrow keys and press the **Tab** key.

3. The word "ALTER" appears in the SQL Editor; type "t" to trigger the next autocompletion popup.

4. Since "TABLE" is already preselected, hit the **Enter** key. The word "TABLE" appears in the SQL Editor.
5. Press **Ctrl+Space** to manually trigger the Autocompletion popup, select "tblVeterinarians" from the list and press the **Space** bar.

6. Type "a", select "ADD" from the list that appears and press **Enter**.
7. Enter "Email" and press the **Space** bar.
8. Enter "v" and select "VARCHAR" from the list.
9. Press the Tab key and enter "(50)". You have now finished creating the SQL statement that will add a new column to tblVeterinarians.

```
1 ALTER TABLE [tblVeterinarians] ADD Email VARCHAR (50)
```

10. Execute the SQL statement by clicking the **Execute**  button or pressing **F5**.
11. In the Online Browser, click the **Refresh database**  button to reload the database.
12. If you have not done so earlier in this tutorial, [import](#) the file tblVeterinarians.txt from the tutorial folder into your database.
13. In the Online Browser, right-click the tblVeterinarians table and select **Retrieve data | All rows** from the context menu; alternatively, select the table and press **Ctrl+Alt+R**.
You will now see an empty column called "Email" in the Result window.

	Address	City	State	Telephone	DOB	Email
1	12 Bivalve Boulevard	Concord	NH	(515)555-2759	[NULL]	[NULL]
2	49 Whaletooth Avenue	Hartford	CT	(515)555-2843	[NULL]	[NULL]
3	31 Marsupial Place	Newark	NJ	(515)555-9352	[NULL]	[NULL]
4	238 Ella Funt Drive	Sacramento	CA	(515)555-7519	[NULL]	[NULL]

5.2.8 Updating Database Data

So far, you have learned how to [create tables](#), [insert data](#) and execute queries to [retrieve data](#) from these tables. This section of the tutorial shows you how to update data contained in the tables of the Zoo database in the Result window of DatabaseSpy.

Objective

In this section of the tutorial, you will learn how to edit database data in the Result window of the SQL Editor. Specifically, you will learn how to do the following:

- [Update a data cell](#) in the Result window
- [Delete record sets](#) in the Result window
- [Copy a row of records](#) and append it to the result grid as a new row

Commands used in this section

Edit Data: This command is located in the context menu that opens when you right-click a table or column in the Online Browser; alternatively, you can also select the table and press **Ctrl+Alt+E**. Choose this command to generate an SQL SELECT statement that is automatically executed in the SQL Editor and switches the Result window into the Editing mode. This command works for all supported database kinds for both ADO and ODBC connections.

Commit: This command is available as a button in the Result window toolbar. Click this button to commit the changes you have made in the result grid to the database. The **Commit** button is only visible if the Result window is in the Editing mode.

Delete row: This command is available as a button in the Result window toolbar. Click this button to delete the row in which the cursor is currently located. Alternatively, you can also right-click a cell in the row to be deleted and choose **Delete row** from the context menu. The **Delete row** command is only available if the Result window is in the Editing mode.

Select row: The **Selection** command, which is located in the context menu that opens when right-clicking a cell in the result grid, opens a sub-menu from where you can choose the **Row** option. Use this command to select the entire row in which the cursor is currently located.

Copy selected cells: This command is located in the context menu that opens when right-clicking a cell in the result grid. Use this command to copy the content of the selected data cells to the clipboard.

Paste as new rows: This command is available if the Result window is in the Editing mode and content has been copied to the clipboard beforehand. It is located in the context menu that opens when right-clicking anywhere in the Result window. Choose this command to append a new row to the result grid and automatically insert the clipboard content.

Editing Records in the Result Window

In the previous section of the tutorial, you have [added a new column](#) for the e-mail address of the veterinarians to the `tblVeterinarians` table. Now you will enter the actual e-mail information into this new column.

You can add this information directly in the Result window of the SQL Editor if you first select the `tblVeterinarians` table for editing.

To edit table records in the Result window:

1. In the Online Browser, right-click the `tblVeterinarians` table and select **Edit Data** from the context menu. Alternatively, select the table and press **Ctrl+Alt+E**.

2. A popup appears, informing you that editing of data is limited for this table.

3. Optionally, click the **Show Details** button to learn which columns cannot be edited.
4. Optionally, if you want to suppress this popup in the future, click the **Don't show this dialog again!** check box.
5. Click **OK** to close the popup and display the data in the Result window.
6. In the result grid, double-click the **Email** cell in the first row. A cursor appears in the cell.

	LastName	Address	City	State	Telephone	DOB	Email
1	Hoofman	12 Bivalve Boulevard	Concord	NH	(515)555-2759	[NULL]	[NULL]
2	Scales	49 Whaletooth Avenue	Hartford	CT	(515)555-2843	[NULL]	[NULL]
3	Wormworth	31 Marsupial Place	Newark	NJ	(515)555-9352	[NULL]	[NULL]

7. Double-click the cell again to have the entire content selected and enter "peggy@yahoo.com".
8. Press the **Enter** key. The color of the updated cell changes. To see the full content of the cell, place the mouse cursor over the cell which will then expand.

9. Click the **Commit** button to save your changes to the database. The updated cell changes back to its default color and the update is committed to the database.

	Address	City	State	Telephone	DOB	Email
1	12 Bivalve Boulevard	Concord	NH	(515)555-2759	[NULL]	peggy@yahoo.com
2	49 Whaletooth Avenue	Hartford	CT	(515)555-2843	[NULL]	[NULL]
3	31 Marsupial Place	Newark	NJ	(515)555-9352	[NULL]	[NULL]
4	238 Ella Funt Drive	Sacramento	CA	(515)555-7519	[NULL]	[NULL]

Deleting a Table Row in the Result Window

One of the veterinarians will not be available for the zoo anymore and the zoo authorities want to have his records deleted from the database. DatabaseSpy allows you to delete a row from a table with a mouse click, provided that the Result window is in the Editing mode.

To delete a row from a database table:

1. Make sure that the Result window is still in the Editing mode.

2. Click somewhere into the sixth row of the result grid and click the **Delete row**  button in the toolbar of the Result window.

	VetID	FirstName	LastName	Address	City	State	Telephone
4	4	Danielle	Batwinger	238 Ella Funt Drive	Sacramento	CA	(515)555-7519
5	5	Robin	Fowler	183 Lionheart Drive	Albuquerque	NM	(515)555-2810
6	5	Jacob	Fisher	87 Bearpaw Circle	Milwaukee	WI	(515)555-7209

The background color of the row as well as the text color change to indicate that this row is to be deleted from the database.

3. Click the  **Commit** button. The row is removed from the result grid and deleted from the database.

	VetID	FirstName	LastName	Address	City	State	Telephone
3	3	Victoria	Wormworth	31 Marsupial Place	Newark	NJ	(515)555-9352
4	4	Danielle	Batwinger	238 Ella Funt Drive	Sacramento	CA	(515)555-7519
5	5	Robin	Fowler	183 Lionheart Drive	Albuquerque	NM	(515)555-2810

Copying Table Rows

In the `tblMedicalTreatments` table, the zookeepers in our tutorial zoo keep records about the medical treatments of the zoo animals. If a disease occurs repeatedly, you can copy a previous entry in this table and append it to the result grid as a new row.

	TreatmentID	TreatmentDate	AnimalID	Problem	VetID
1	1	2006-01-09T00:00:00	5000	Heartworms	1
2	2	2005-02-28T00:00:00	5001	Equine Infectious Anemia	4
3	3	2005-12-13T00:00:00	5003	Erysipelas	6
4	4	2005-06-17T00:00:00	5004	Newcastle Disease	2
5	5	2005-06-30T00:00:00	5004	Newcastle Disease	6
6	6	2005-12-31T00:00:00	5005	Bird Flu	6
7	7	2006-02-01T00:00:00	5006	tetanus vaccination	1
8	8	2006-02-01T00:00:00	5007	tetanus vaccination	1

In the screenshot above, you can see that the zoo's hill mynah (AnimalID 5004) suffered from the Newcastle Disease already twice. In this section of the tutorial, you will copy a previous treatment and add it to the medical treatments record.

To copy a row and append it to the result grid:

1. In the Online Browser, right-click the `tblMedicalTreatments` table and select **Edit Data** from the context menu.
2. In the Result window, right-click into the fifth row and select **Selection | Row** from the context menu.
3. Right-click again and select **Copy selected cells** from the context menu.
4. Right-click anywhere in the result grid and select **Paste as new rows** from the context menu.
5. Double-click the `TreatmentDate` cell of the new row and enter the new date of the treatment.

	TreatmentID	TreatmentDate	AnimalID	Problem	VetID
6	6	2005-12-31T00:00:00	5005	Bird Flu	6
7	7	2006-02-01T00:00:00	5006	tetanus vaccination	1
8	8	2006-02-01T00:00:00	5007	tetanus vaccination	1
9		2007-06-30T00:00:00	5004	Newcastle Disease	6

6. If required, change the `VetID` table if a different veterinarian is responsible for the treatment.
7. Click the  button to actually add the new row to the database.

5.2.9 Designating Database Objects as Favorites

DatabaseSpy's Favorites feature allows you to put database objects into the **Favorites** folder so that you have quick access to them.

Objective

In this section of the tutorial, you will learn how to add tables that need to be updated frequently to the Favorites folder of a database project.

Commands used in this section

Add to/Remove from Favorites: This command is located in the context menu that opens when you right-click a table or column in the Online Browser. Click this command to add the selected item to the Favorites folder in the Project window.

Show Favorites: This command is located in the toolbar of the Online Browser. Clicking this command toggles the Favorites view on and off. Note that this icon is unavailable if no items have been added to the Favorites folder yet.

Adding Objects to the Favorites Folder

Some of the tables in the zoo database need to be queried or to have their data updated more often than others. For example, `tblAnimalFeed` needs to be updated every time the amount of a type of feed that the zoo keeps in storage changes. `tblMedicalTreatments` needs to be updated whenever a veterinarian visits. Adding these tables to the Favorites folder in the Project window provides you with quick access to these tables.

To add tables to the Favorites folder:

1. In the Online Browser, right-click table `tblAnimalFeed` and select **Add to/Remove from Favorites** from the context menu, or select the table and press **Ctrl+F2**.
2. Select the menu option **Tools | Options** and, on the Online Browser page, make sure that the `Enable full row selection` check box is activated. Click **OK** to confirm your change, if applicable.
3. In the Online Browser, move the mouse over table `tblMedicalTreatments` and click the favorites icon that appears to the right of the table name.

Tables that have been added to the Favorites folder are shown in bold type in the Online Browser.

4. Click the **Show Favorites**  icon to switch to the favorites view.

Note that the **Show Favorites** icon is now active and that only favorite items are shown in the Online Browser.

5. Click the **Show Favorites** icon again to switch back to the normal Online Browser view.
6. Click the Project tab to change to the Project window.
Note that the favorite items have been added to the Favorites folder in the Project window.

7. Click the **Show in Online Browser** icon to the right of an item in the Favorites folder to display the corresponding database object in the Online Browser.

5.2.10 Exporting Database Data

Objective

In this section of the tutorial, you will learn how to export data from the zoo database. Specifically, you will learn how to do the following:

- Select tables for the export to XML files
- Preview the data to be exported
- Specify the path for the export file

Commands used in this section

Export: This command is located in the Tools toolbar; alternatively, you can also choose the menu option **Tools | Export database data...** or press **Ctrl+E**. Clicking this command opens the **Export database data** dialog box.

Exporting Tables to XML

The **Export database data** dialog box allows you to select individual tables for export and choose the desired export format. Furthermore, you can specify a folder where the export files are to be stored, and preview the data before actually exporting it.

To export table data to XML:

1. Click the **Export**  button in the Tools toolbar. The **Export database data** dialog box opens.
2. Click the **XML** icon at the left side.
3. In the Source group box, click the respective check boxes of `tblAnimalCategories` and `tblAnimalTypes`.
Note that Filters, Favorites, and Locators can be used to limit the amount of tables in this tree.
4. Optionally, activate the **Show checked objects only** ☒ check box to hide objects not

selected for export.

5. In the Destination group box, enter "ZooDB_" as a prefix that will be added to the exported tables.
6. Select the destination path of the XML files, C:\TEMP in this case.
7. Select one of the tables to be exported and click the **Preview** button in the Preview group box to preview the table before exporting it.
8. Click **Export**.
A separate XML file for each of the selected tables is created at the specified location.
9. Double click one of the exported XML files to check its contents.

```

1  <?xml version="1.0" encoding="UTF-8"?>
2  <Import name="tblAnimalTypes" query="SELECT [AnimalTypeID],
3  ">
4      <!--MS SQL Server-->
5      <!--Column name:AnimalTypeID type:int-->
6      <!--Column name:EnglishName type:varchar maxlength:50-->
7      <!--Column name:LatinName type:varchar maxlength:50-->
8      <!--Column name:AreaOfOrigin type:varchar maxlength:50-->
9      <!--Column name:Category type:int-->
10     <Row>
11         <AnimalTypeID>1</AnimalTypeID>
12         <EnglishName>Parma wallaby</EnglishName>
13         <LatinName>Macropus parma</LatinName>
14         <AreaOfOrigin>Australia</AreaOfOrigin>
15         <Category>1</Category>
16     </Row>

```

5.2.11 Comparing Database Schemas

The schema comparison feature in DatabaseSpy allows you to compare and merge the structure of different schemas of a database or schemas in different database types. In our zoo tutorial, you will compare the live database with a test environment that runs on the same database server.

Objective

In this section of the tutorial, you will learn how to compare the structure of two schemas of a database and merge differences between the schemas. Specifically, you will learn how to do the following:

- [Add a schema](#) to the zoo database and add tables using an SQL script
- [Set up a database schema comparison](#) and select items for comparison
- Review and [correct the mapping](#)
- [Compare the structure of two schemas](#) of the zoo database
- Show and [examine the differences](#)
- [Merge the differences](#) between the two schemas

Commands used in this section

Open File...: This command is located in the **File | Open** menu and opens the Windows **Open** dialog box. Alternatively, you can also use the keyboard shortcut **Ctrl+O**.

Execute: This command is located in the toolbar of an SQL Editor window and in the **SQL Editor** menu. Click this command to execute the SQL in the SQL Editor window.

Refresh: This command is available in the Online Browser as a button, or as an option in the context menu that opens when you right-click a database. Use this command to refresh the database and display new or changed database objects in the Online Browser.

Schema Comparison: This command is located in the Standard toolbar; alternatively, you can also choose the menu option **File | New | Schema Comparison**. Click this command to open a new Schema Comparison window and select database items for comparison. Note that at least one active connection to a data source is required to open a new schema comparison.

Start Comparison: This command is located in the toolbar of the Schema Comparison window; alternatively, you can also choose the menu option **Schema Comparison | Compare items** or choose **Compare items** from the context menu that opens when you right-click the title bar of a component. Click this command to run a comparison of all mapped items in the comparison components.

Toggle Message Window: This command is located in the Schema Comparison window toolbar. Use this command to switch the display of the Message window on and off.

Collapse items: This command is available in the **Schema Comparison** menu, or as an option in the context menu that opens when you right-click the title bar of a comparison component. Use this command to collapse all items in both components.

Show merge script: Left to Right: This command is available in the **Schema Comparison** menu, or as an option in the context menu that opens when you right-click the title bar of, or a database item in, a comparison component. Use this command to show the merge script that copies the changes in the left component into the right component. If called from the title bar of a component or when no item is selected, this command will generate the merge script for all items in the component.

Show merge script: Right to Left: This command is available in the **Schema Comparison** menu, or as an option in the context menu that opens when you right-click the title bar of, or a database item in, a comparison component. Use this command to show the merge script that copies the changes in the right component into the left component. If called from the title bar of a component or when no item is selected, this command will generate the merge script for all items in the component.

Adding a Schema

The tutorial folder of your DatabaseSpy installation contains an SQL script that will create a new schema in your zoo database and add all zoo tables to it. You will open and execute this script in the SQL Editor.

To add schema "test" to the zoo database:

1. Select the menu option **File | Open | Open File...** or press **Ctrl+O** to open the Windows **Open** dialog box.
2. Navigate to the tutorial folder (Altova\DatabaseSpy2012\DatabaseSpyExamples\Tutorial sub-folder of the [\(My\) Documents](#) folder), select CreateTestSchema.sql and click **Open**. The script opens in a new SQL Editor window.
3. In the Properties window, select "ZooDBConnect" from the **Data Source** drop-down list.
4. Click the **Execute**  button in the SQL Editor toolbar or press **F5**.

5. In the Online Browser, click the **Refresh**  button in the toolbar or right-click ZooDB and select **Refresh** from the context menu.

Setting Up a Database Schema Comparison

DatabaseSpy provides a Schema Comparison window which is used to select schemas and tables, and to map database items, start a comparison, and display the merge script for the compared items. Opening a Schema Comparison window and selecting the schemas and database items to be compared is usually done in a single step.

To select schemas for comparison:

1. Click the **Schema Comparison**  button in the Standard toolbar or select the menu option **File | New | Schema Comparison**. A new Schema Comparison window is opened and the **Select Database Objects for Comparison** dialog box appears, where the first data source connection, ZooDBConnect, is preselected in the **Data Source** drop-down list, and the **Left Side** button is activated by default.
2. Expand the tree structure in the selection dialog box until the schemas are displayed, expand schema **dbo** and activate the **User Tables** check box. This selects all tables in the User Tables folder.

3. Click the **Right Side** button, expand schema test and also activate the `User Tables` check box.

4. Click **OK**. The tables appear in two separate components of the Schema Comparison window, and matching items are mapped automatically.
5. Select the menu option **Schema Comparison | Collapse items** or select this command from the context menu that opens when you right-click the header of either component in the Schema Comparison window.

6. Optionally, if the sort order is different in the left and right component, select the menu option **Schema Comparison | Sort items | Ascending** or select this command from the context menu that opens when you right-click the header of either component in the Schema Comparison window.

Mapping Items

Normally, corresponding items are mapped automatically in DatabaseSpy, however if, for example, different naming conventions are applied on the compared databases, automatic mapping might fail. In this case, you can still map corresponding items manually, by drawing a line between the respective items.

If you check the sorted tables in your database schema comparison, you will notice that item `dbo.tblVeterinarians` is not mapped to `test.tblVets`. Obviously, the difference in the name of the two items was too big for the automatic mapping to identify these two items as a comparison pair.

We will now take a closer look on these two items to determine whether or not they can be

considered corresponding. Double-click the items or click the plus sign to expand the table in the comparison components. Since the columns that are contained in the table are pretty similar in the left and right components, we can map them and hence include them in the comparison. Note that all child items of the tables that are equal on both sides will be mapped automatically when you draw the connection line between the parent.

Two column pairs, LastName/Name and Telephone/Phone, are still unmapped, if you further expand these items, you will see that data types as well as Nullable constraints are equal on both sides and that these items can also be mapped safely.

To manually map dbo.tblVeterinarians and test.tblVets:

1. In the Schema Comparison window, click the triangle next to dbo.tblVeterinarians and, keeping the mouse button pressed, draw a line to test.tblVets. Release the mouse button when the cursor changes its shape.

2. Double-click either dbo.tblVeterinarians or test.tblVets to expand the table in both components and map column LastName to column Name as described in step 1.

3. In the same way, map column Telephone to column Phone.

Starting a Comparison

You can start a comparison from the **Schema Comparison** menu or by clicking the **Start Comparison**  button in the toolbar of the Schema Comparison window. Alternatively, you can also right-click the title bar of either component and choose **Compare items** from the context menu. This way, you run a comparison for all mapped items in the database comparison components. DatabaseSpy displays comparison result icons that indicate whether a pair of mapped items is equal or contains differences.

Please note that there are three different kinds of differences displayed in the above screenshot:

- `tblAnimals` and `tblMedicalTreatments` show a Different  sign on both sides of the comparison and the table names are not highlighted:

This indicates that the table name itself is equal, however, one or more child items are different. Expand the table to learn where the differences occur.

- tblFeedingSchedules and tblZookeepers show a Different  sign on one side and an Equal  sign on the other side of the comparison; the table names are not highlighted:

This indicates that the tables are equal but there is at least one additional item in the table that shows the Different sign. If you expand this table, these additional items are not mapped and indicated with a question mark .

- dbo.tblVeterinarians and test.tblVets, respectively, show a Different  sign and their table names are highlighted:

This indicates that the table names are different but the tables have nevertheless been (manually) mapped. Expand the tables to see if any child items are also different.

A summary of the comparison result on table level is displayed in the Message window. Click the **Toggle Message Window**  button if the Message window is not displayed.

To view the differences in more detail—that is, on item level—you have to [examine the comparison results in the components](#). All items that contain differences are automatically expanded in the components so as to allow for easy identification of differences.

To compare all mapped items:

Do one of the following:

- Select the menu option **Schema Comparison | Compare items**.
- Click the **Start Comparison**  button in the toolbar of the Schema Comparison window.
- Right-click the title bar in either comparison component and choose **Compare items** from the context menu.

Examining the Differences

When you start a schema comparison in DatabaseSpy, all items in the comparison components are expanded and scrollbars are displayed so that you are able to scroll through the items and check for differences. DatabaseSpy uses icons to identify tables that contain differences, and color coding to indicate the particular difference itself. So, if you are examining your comparison result for differences, we recommend a top-down approach: Start at the top and collapse any table that does not contain differences. If a table with differences appears do the same on item level, that is, collapse all the items that are equal on both sides of the comparison. Eventually, only different items in tables that contain differences are displayed.

Merging Schemas

After you have [started a comparison](#) and [examined the differences](#) between the schemas, you can merge the two schemas. Since changes to the database structure cannot be easily undone, DatabaseSpy will not directly perform a merge but display the merge script in an SQL Editor window where you can review the script and execute it if you are sure that the changes to the schema structure should be committed to the database.

You can either merge all differences at once (i.e., create one merge script that contains all the changes to the schema structure) or choose one or more particular differences to merge (i.e.,

create a merge script that contains selected changes). The merge itself can be performed in both directions, that is, from left to right or from right to left. You can therefore also decide to mix the schema structure by merging some changes from left to right and others from right to left.

The screenshot below shows the merge script for copying the structure of schema "dbo" to schema "test" (merge left to right).

```
1  SP_RENAME '[test].[tblVets]','tblVeterinarians';
2
3  SP_RENAME '[test].[tblVeterinarians].[Name]','
   LastName','COLUMN';
4
5  SP_RENAME '[test].[tblVeterinarians].[Phone]','
   Telephone','COLUMN';
6
7  ALTER TABLE [ZooDB].[test].[tblAnimals] ALTER
   COLUMN [AnimalWeight] bigint NOT NULL;
8
9  ALTER TABLE [ZooDB].[test].[tblMedicalTreatments]
   ALTER COLUMN [Problem] varchar (500) COLLATE
   SQL_Latin1_General_CP1_CI_AS NULL;
10
11 ALTER TABLE [ZooDB].[test].[tblVeterinarians] ADD
   [Email] varchar (50) COLLATE
   SQL_Latin1_General_CP1_CI_AS NULL;
12
13 ALTER TABLE [ZooDB].[test].[tblFeedingSchedules]
   ADD [Notes] varchar (200) COLLATE
   SQL_Latin1_General_CP1_CI_AS NULL;
```

A different merge script is generated if you decide to merge the changes from right to left:

```
1 ALTER TABLE [ZooDB].[dbo].[tblAnimalBirths] DROP CONSTRAINT
  [FK_VetID2];
2
3 SP_RENAME '[dbo].[tblVeterinarians]','tblVets';
4
5 SP_RENAME '[dbo].[tblVets].[LastName]','Name','COLUMN';
6
7 SP_RENAME '[dbo].[tblVets].[Telephone]','Phone','COLUMN';
8
9 ALTER TABLE [ZooDB].[dbo].[tblAnimals] ALTER COLUMN
  [AnimalWeight] int NOT NULL;
10
11 ALTER TABLE [ZooDB].[dbo].[tblMedicalTreatments] ALTER COLUMN
  [Problem] varchar (300) COLLATE SQL_Latin1_General_CP1_CI_AS
  NULL;
12
13 ALTER TABLE [ZooDB].[dbo].[tblZookeepers] ADD [Email] varchar
  (50) COLLATE SQL_Latin1_General_CP1_CI_AS NULL;
14
15 ALTER TABLE [ZooDB].[dbo].[tblAnimalBirths]
16     ADD CONSTRAINT [FK_VetID2]
17         FOREIGN KEY ([Veterinarian])
18             REFERENCES [ZooDB].[dbo].[tblVets] ([VetID]) ;
```

In this section of the tutorial, you will rename test.tblVets to test.tblVeterinarians (merge left to right) and add the e-mail column to both dbo.tblZookeepers (merge right to left) and test.tblVeterinarians (merge left to right).

To merge schemas in the zoo database:

1. Select the menu option **Schema Comparison | Collapse items** or right-click the title bar of either component and choose **Collapse items** from the context menu.
2. Expand database and schema and select either dbo.tblVeterinarians or test.tblVets.
3. Select the menu option **Schema Comparison | Show merge script: Left to Right** or right-click the table in the component and choose **Show merge script: Left to Right** from the context menu. The merge script is displayed in a new SQL Editor window.

Note that the script contains only SQL for renaming the table itself; remember that there were also two columns with different names in this table. To generate a merge script that not only renames the table but also the two columns, you have to select the columns as well before you generate the merge script. Close the SQL Editor window without executing or saving the script, and get back to the Schema Comparison window.

4. Expand tblVeterinarians and select the table name as well as columns LastName, Telephone, and Email (hold down the **Ctrl** key to select multiple items).

5. Select the menu option **Schema Comparison | Show merge script: Left to Right** and check the merge script in the SQL Editor.

Now both table and columns will be renamed and the column Email will be added to schema test.

6. Make sure that the SQL Editor is still connected to ZooDB and click **Execute** .
7. In the Online Browser, click the **Refresh**  button in the toolbar or right-click ZooDB and select **Refresh** from the context menu. Note that dbo.tblVeterinarians now appears unmapped in the Schema Comparison window.

8. Double-click the title bar of the right comparison component and select the renamed

table tblVeterinarians in the **Select Database Objects for Comparison** dialog box.

9. Click the **Compare**  button in the comparison window toolbar. No differences now exist between dbo.tblVeterinarians and test.tblVeterinarians.
10. Expand test.tblZookeepers, right-click column Email and select **Show merge script: Right to Left** from the context menu.

```
1 ALTER TABLE [ZooDB].[dbo].[tblZookeepers] ADD [Email]
   varchar (50) COLLATE SQL_Latin1_General_CP1_CI_AS NULL;
```

11. Execute the merge script, refresh the database, and run a comparison to see the changes in the Schema Comparison window. No differences now exist between dbo.tblZookeepers and test.tblZookeepers.

5.2.12 Comparing Database Data

It may happen that you have to restore data from a backup database, or that you migrate your database tables to a different database provider. DatabaseSpy provides a database data comparison and merging feature that can assist you in these tasks.

Objective

In this section of the tutorial, you will learn how to compare database data and show the comparison results. Specifically, you will learn how to do the following:

- [Set up a data comparison](#) and [select tables](#) for comparison
- [Start](#) a comparison
- [Show the results](#) in the Comparison Result window
- [Change the automatic mapping and remove tables](#) from comparison components
- [Merge](#) database data

Commands used in this section

Add a New Data Source... This command is located in the context menu that opens when you right-click the Data Sources folder in the Project window. Click this command to add an additional data source to your project.

Save Project: This command is located in the toolbar of the Project window; alternatively, you can also choose the menu option **File | Save Project As...** or press **Ctrl+S**. Click this command to save an existing project under its project name or to specify a name and path for a new project, respectively.

Data Comparison: This command is located in the Standard toolbar; alternatively, you can also choose the menu option **File | New | Data Comparison**. Click this command to open a new Data Comparison window and select tables for comparison. Note that at least one active connection to a data source is required to open a new data comparison.

Start Comparison: This command is located in the toolbar of the Data Comparison window; alternatively, you can also choose the menu option **Data Comparison | Compare tables** or choose **Compare tables** from the context menu that opens when you right-click the title bar of a component. Click this command to run a comparison of all mapped tables in the comparison components.

Show selected results: This command is located in the context menu that opens when you right-click a table in a component of a Data Comparison window; alternatively, you

can also select a table in a component and click the **Show result**  icon in the toolbar of the Data Comparison Result window. Click this command to display the detailed comparison results for the selected table.

Show/Hide all equal rows: This command is located in the context menu that opens when you right-click into the Data Comparison Result window; alternatively, you can also use the **Show/Hide all equal rows** toggle button in the toolbar of the Data Comparison window. Deactivate this option to hide all rows that are equal in both of the compared tables.

Show/Hide rows that are only on the left: This command is located as a toggle button in the toolbar of the Data Comparison Result window; alternatively, you can also choose this option from the context menu that opens when you right-click into the Data Comparison Result window. Deactivate this option to hide rows that exist only in the table that is on the left side of the comparison.

Show/Hide columns which don't have any differences: This command is located as a toggle button in the toolbar of the Data Comparison Result window. Deactivate this option to hide all columns that do not contain differences.

Find: This command is located as a toolbar button in the Data Comparison Result window. Click this command to open the **Find** dialog box and enter the string that you search for in the comparison result grid.

Merge data from right to left: This command is located as a toolbar button in the Data Comparison Result window. Click this command to copy data from the table in the right comparison component to the mapped table in the left component.

Execute: This command is located in the toolbar of an SQL Editor window and in the **SQL Editor** menu. Click this command to execute the SQL in the SQL Editor window.

Refresh: This command is available in the Online Browser as a button, or as an option in the context menu that opens when you right-click a database. Use this command to refresh the database and display new or changed database objects in the Online Browser.

SQL and Data | Retrieve data | All rows: This command is located in the context menu that opens when you right-click a table or column in a component of the Data Comparison window. Click this command to have all rows of data displayed in a Result tab.

SQL and Data | Edit Data: This command is located in the context menu that opens when you right-click a table or column in a component of the Data Comparison window. Choose this command to generate an SQL SELECT statement that is automatically executed in the SQL Editor and switches the Result window into the Editing mode. This command works for all supported database kinds for both ADO and ODBC connections.

Delete row: This command is available as a button in the Result window toolbar. Click this button to delete the row in which the cursor is currently located. Alternatively, you can also right-click a cell in the row to be deleted and choose **Delete row** from the context menu. The **Delete row** command is only available if the Result window is in the Editing mode.

: This command is available as a button in the Result window toolbar. Click this button to commit the changes you have made in the result grid to the database. The **Commit** button is only visible if the Result window is in the Editing mode.

Setting Up a Database Data Comparison

The tutorial folder of your DatabaseSpy installation contains a Microsoft Access 2003 database which serves as a backup database for your tutorial zoo database. In this step of the tutorial, you will add this database to your tutorial project and select the tables in both databases for comparison.

To add the ZooDB-Backup data source to your project:

1. In the Project window, right-click the Data Sources folder and select **Add a New Data Source...** from the context menu.

2. In the **Add a Data Source** dialog box, choose the `Microsoft Access ( ADO )` option button and click **Next**.
3. On the **Connect to MS Access** page, click the **Browse** button and navigate to the tutorial folder (\\Altova\\DatabaseSpy2012\\DatabaseSpyExamples\\Tutorial sub-folder of the [\(My\) Documents](#) folder).
4. Select the ZooDB.mdb database and click **Next**.
5. In the **Set A Data Source Name** dialog box, enter "ZooDB-Backup" and click **OK**. The data source is added to the project and a connection to it is automatically established.
6. Click the **Save Project**  button in the Project window toolbar or press **Ctrl+S**.

Opening a Data Comparison window

DatabaseSpy provides a Data Comparison window which is used to select and map tables, start a comparison, and merge data of the compared tables. Opening a Data Comparison window and selecting the tables (and columns) to be compared is usually done in a single step.

To select tables for comparison:

1. Click the **Data Comparison**  button in the Standard toolbar or select the menu option **File | New | Data Comparison**. A new Data Comparison window is opened and the **Select Database Objects for Comparison** dialog box appears, where the first data source connection, ZooDBConnect, is preselected in the `Data Source` drop-down list, and the **Left Side** button is activated by default.
2. Expand the tree structure in the selection dialog box until the tables are displayed and activate the `User Tables` check box. This selects all tables in the `User Tables` folder.

3. Click the **Right Side** button and select "ZooDB-Backup" from the `Data Source` drop-down list.

4. Expand the tree structure in the selection dialog box until the tables are displayed and activate the `User Tables` check box. This selects all tables in the `User Tables` folder.

5. Click **OK**. The tables appear in two separate components of the Data Comparison window, and matching tables and columns are mapped automatically.
6. Select the menu option **Data Comparison | Collapse tables** or select this command from the context menu that opens when you right-click the header of either component in the Data Comparison window.

7. Optionally, if the sort order is different in the left and right component, select the menu option **Data Comparison | Sort tables | Ascending** or select this command from the context menu that opens when you right-click the header of either component in the Data Comparison window.

Starting a Comparison

You can start a comparison from the **Data Comparison** menu or by clicking the **Start**

Comparison  button in the toolbar of the Data Comparison window. This way, you run a comparison for all mapped tables in the database comparison components. DatabaseSpy displays the row count for the compared tables and shows comparison result icons that indicate whether a pair of mapped tables is equal or contains differences. Place your mouse cursor over a comparison result icon to display a brief summary of the comparison result.

To compare all mapped tables:

- Select the menu option **Data Comparison | Compare tables**.
- Click the **Start Comparison**  button in the toolbar of the Data Comparison window.
- Right-click the title bar in either comparison component and choose **Compare tables** from the context menu.

To show a brief comparison result for tblMedicalTreatments:

- Place the mouse cursor over the comparison result icon  of table tblMedicalTreatments. A balloon help appears with an overview of the comparison result (see screenshot above).

Results in the Message window

The Message window below the Data Comparison window logs for which tables a comparison has been started and displays brief summaries of the individual comparison results. The message window also provides hyperlinks to the tables in the Data Comparison windows and to the detailed results of a specific comparison in the Comparison result window.

Showing the Results

In the previous step of the tutorial, you have learned how to [start](#) a comparison and [display an overview of a comparison result](#) directly in the Data Comparison window or in the Message window. Now you will have a more detailed look on the differences between the two versions of

table tblAnimalBirths that you have compared earlier in this tutorial.

If you display the comparison result overview (either by placing the mouse cursor over the comparison result icon of tblAnimalBirths in the Data Comparison window, or by expanding the relevant row in the Summary section of the Message window), you learn that

- two rows are different and
- three rows are only on the left side

of your comparison of tblAnimalBirths. You can inspect this comparison result more closely in the Data Comparison Result window.

	BirthID	BirthID	BirthDate	BirthDate	Mother	Mother	Father	Father	Vet...	Vet...	Num...	Num...
1	1	1	2005-01-16...	2005-01-16...	5055	5056	5056	5055	4	4	3	3
2	2	2	2006-03-23...	2006-03-23...	5061	5062	5063	5063	2	2	1	1
3	3		2005-11-07...		5055		5054		6		4	
4	4		2006-02-17...		5048		5047		6		2	
5	5	5	2006-10-04...	2006-10-04...	5127	5127	5002	5002	4	4	5	5
6	6	6	2006-05-24...	2006-05-24...	5026	5026	5025	5025	4	4	1	1
7	7	7	2005-09-14...	2005-09-14...	5051	5051	5050	5050	1	1	1	1
8	8		2006-05-23...		5036		5035		6		6	
9	9	9	2005-12-03...	2005-12-03...	5068	5068	5069	5069	2	2	1	1
10	10	10	2006-02-05...	2006-02-05...	5073	5073	5072	5072	4	4	1	1

To show the detailed comparison result for tblAnimalBirths:

Do one of the following:

- Click the comparison result icon  next to tblAnimalBirths.

- Right-click tblAnimalBirths and select **Show selected results** from the context menu.

- In the Result window, click the Show result window hyperlink for tblAnimalBirths.

Showing all results

You can also open all comparison results in the Data Comparison Result window with a single click. At the bottom of the Message window, DatabaseSpy provides two hyperlinks, [Show only results with differences](#) and [Show all results](#), which open the results in separate tabs of the Data Comparison Result window.

Configuring the Result view

The Data Comparison Result window provides several buttons which allow you to show or hide rows with a certain comparison result. For example, you can hide all rows that are equal on the left and right side of the comparison or show only non-equal rows but hide rows that exist only on the left side of the comparison.

To hide all equal rows in the Data Comparison Result window:

- Right-click into the Data Comparison Result window and deactivate the context menu option **Show/Hide all equal rows**.

Only non-equal rows are displayed in the Data Comparison Result window.

	BirthID	BirthID	BirthDate	BirthDate	Mother	Mother	Father	Father	Vet...	Vet...	Num...	Num...
1	1	1	2005-01-16...	2005-01-16...	5055	5056	5056	5055	4	4	3	3
2	2	2	2006-03-23...	2006-03-23...	5061	5062	5063	5063	2	2	1	1
3	3		2005-11-07...		5055		5054		6		4	
4	4		2006-02-17...		5048		5047		6		2	
5	8		2006-05-23...		5036		5035		6		6	

In the next step, you will also hide all rows that occur only on the left side of the comparison and display only those rows that exist in both tables and are different on the left and right side.

To hide all rows that exist only on the left side:

- In the Data Comparison Result window, deactivate the **Show/Hide rows that are only on the left**  button in the toolbar.

	BirthID	BirthID	BirthDate	BirthDate	Mother	Mother
1	1	1	2005-01-16 00:0...	2005-01-16 00:0...	5055	5056

Now only rows are displayed that exist in both tables and are different on the left and on the right side.

	BirthID	BirthID	BirthDate	BirthDate	Mother	Mother	Father	Father	Vet...	Vet...	Num...	Num...
1	1	1	2005-01-16...	2005-01-16...	5055	5056	5056	5055	4	4	3	3
2	2	2	2006-03-23...	2006-03-23...	5061	5062	5063	5063	2	2	1	1

Since a lot of columns are now displayed where no differences occur, you can also hide these columns and restrict the display to exact those columns and rows which are different in the two tables.

To hide all columns where no differences occur:

- In the Data Comparison Result window, deactivate the **Show/Hide columns which don't have any differences**  button in the toolbar.

	BirthID	BirthID	BirthDate	BirthDate	Mother	Mother	Father
1	1	1	2005-01-16...	2005-01-16...	5055	5056	5056
2	2	2	2006-03-23...	2006-03-23...	5061	5062	5063

Only two rows and two columns are now displayed in the Data Comparison Result window – exactly those data sets where the differences occur.

	Mother	Mother	Father	Father
1	5055	5056	5056	5055
2	5061	5062	5063	5063

Unmapping and Removing Tables

You have seen in the previous step of the tutorial that some of the tables are equal in both databases. When examining the differences, you can unmap these tables and remove them from the comparison components.

To unmap and remove equal tables:

- Right-click tblAnimalCategories and choose **Unmap selected** from the context menu.

2. Click the connection line between the two versions of tblAnimalFeed and hit the **Del** key.

3. Right-click the connector between the two versions of tblAnimals and choose **Unmap selected** from the context menu.

4. Click tblAnimalTypes in the left component and hit the **Del** key. This deletes the mapping and removes tblAnimalTypes from the left component.

- Double-click the header of ZooDB-Backup in the right component and deselect `tblAnimalCategories`, `tblAnimalFeed`, `tblAnimalTypes`, and `tblAnimals`.

- Select `tblAnimalCategories`, `tblAnimalFeed`, and `tblAnimals` in the left component and hit the **Del** key.

Merging Tables

Let's pretend that one of our [recently hired zookeepers](#), Bruno Katz, has a degree on veterinary medicine and now joins the team of veterinarians of our tutorial zoo. In this step of the tutorial, you will transfer Bruno's record from `tblZookeepers` to `tblVeterinarians` using DatabaseSpy's merging functionality.

To transfer a record set to another table:

- Click the **Data Comparison**  button in the Standard toolbar to open a new Data Comparison window.
- In the **Select Database Objects for Comparison** dialog box, choose "ZooDBConnect" in the **Data Source** drop-down list, and activate the `tblVeterinarians` and `tblZookeepers` check boxes in the Source group box.
- Click **OK**. Both tables are added to the left comparison component; the right component remains empty with no data source assigned.

4. Click `dbo.tblZookeepers` and, keeping the mouse button pressed, drag the table into the right component. Note that both components now have the same data source assigned.
5. Click the triangle next to `dbo.tblVeterinarians` in the left component and, keeping the mouse button pressed, draw a line to the triangle next to `dbo.tblZookeepers` in the right component. Release the mouse button when the shape of the cursor changes.

All columns except `VetID` and `ZookID` are also mapped automatically.

6. In the same way, map column `VetID` with column `ZookID`.
7. Click the **Start Comparison**  button in the toolbar of the Data Comparison window.
8. Select the menu option **Data Comparison | Show results**.
9. In Data Comparison Result window, click the **Find**  button in the toolbar, enter "Katz" in the `Find what` field, and click **Find next**.
10. Close the **Find** dialog box and click the **Merge data from right to left**  button in the toolbar. The **Merge data (Right to Left)** dialog box appears.

11. Click the **Show Merge script** button and edit the merge script as follows (delete the first column [VetID] , and the first value 15,):

```
INSERT INTO [ ZooDB].[ dbo].[ tblVeterinarians]([ FirstName],
[ LastName],[ Address],[ City],[ State],[ Telephone],[ DOB]) VALUES(
' Bruno',' Katz',' 87 Panther Place',' Trenton',' NJ',' ( 515) 555-7667'
,' 1969-09-13 00:00:00.000');
```

12. Click the **Execute**  button or press **F5**.
13. In the Online Browser, select the ZooDB database in the ZooDBConnect data source and click the **Refresh**  button in the Online Browser toolbar.
14. In the Data Comparison window, right-click tblVeterinarians and select **SQL and Data | Retrieve data | All rows** from the context menu. Bruno Katz has been added to the list of veterinarians.

	VetID	FirstName	LastName	Address	City	State	Telephone	D
5	5	Robin	Fowler	183 Lionheart Drive	Albuquerque	NM	(515)555-2810	f
6	6	Jacob	Fisher	87 Bearpaw Circle	Milwaukee	WI	(515)555-7209	f
7	7	Bruno	Katz	87 Panther Place	Trenton	NJ	(515)555-7667	1

15. In the Data Comparison window, right-click tblZookeepers and select **SQL and Data | Edit data** from the context menu.
16. Click **OK** in the message box that appears and select Bruno Katz in the result grid.
17. Click **Delete row**  in the toolbar and click the **Commit**  button to save the change to the database.

Chapter 6

DatabaseSpy Projects

6 DatabaseSpy Projects

Altova web site:  [database_projects](http://www.altova.com/database_projects)

A DatabaseSpy Project combines everything that you need when working with your databases in a single project file. It includes data source connections, SQL files, database design files, and comparison files for data and schemas. You can also define favorites for your most frequently used files or database objects.

The content of your project is displayed in the [Project](#) window.

Please note: As of version 2008, projects are stored in a different file format. Therefore, as of DatabaseSpy 2008 projects that have been saved **cannot be opened in earlier releases!**

Managing projects

Every time you start DatabaseSpy (and provided that you have not changed the default setting of the `Open last project on startup` check box in the [General options](#)), an empty project is displayed in the Project window. You must at least add a data source to it and save it in your file system.

If DatabaseSpy starts with the last project, you can create a new project by proceeding as follows:

- In the Project window, click the **Create a new project**  button or select the menu option **File | New | Project**.
If there is an unsaved project already open in the Project window, you are prompted to save this project. After you have decided what to do with the unsaved project, a new, empty project appears in the Project window.

If you want to open an already existing DatabaseSpy Project do one of the following:

- In the Project window, click the **Open a project**  button or select the menu option **File | Open | Open Project** and choose a project file from the **Open** dialog box.
- Select the menu option **File | Open | Open File...**, select "Altova DatabaseSpy Project (*.qprj)" from the **Files of type** drop-down list, and choose a project file from the **Open** dialog box.
If there is an unsaved project already open in the Project window, you are prompted to save this project.

A project is displayed with its file name in DatabaseSpy, so if you save a project make sure that you choose a descriptive name for the *.qprj file. You can rename a project only by changing its file name.

To save a project:

- In the Project window, click the **Save Project**  button or select the menu option **File | Save | Save Project**.
- To save the project under a new name and change its title:
 1. Select the menu option **File | Save | Save Project As....**
 2. Select the folder where you want to save the project file and enter a name for the file.
 3. Click **Save**.

To close a project:

- Open an existing or a new project.

To delete a project:

- Delete the respective *.qprj file from your hard disk.

6.1 Altova Global Resources

Altova Global Resources is a collection of aliases for file, folder, and database resources. Each alias can have multiple configurations, and each configuration maps to a single resource

Therefore, when a global resource is used as an input, the global resource can be switched among its configurations. This is done easily via controls in the GUI. For example, an SQL file or data source connection can be changed with a couple of mouse-clicks, and a query can be executed without having to change the data source or SQL statement.

A global resource can not only be used to switch resources within an Altova application, but also to generate and use resources from other Altova applications. So, files can be generated on-the-fly in one Altova application for use in another Altova application. All of this tremendously eases and speeds up development and testing.

Using Altova Global Resources involves two processes:

- [Defining Global Resources](#): Resources are defined and the definitions are stored in an XML file. These resources can be shared across multiple Altova applications.
- [Using Global Resources](#): Within an Altova application, files can be located via a global resource instead of via a file path. The advantage is that the resource being used can be instantly changed by changing the active configuration in DatabaseSpy.

Global resources in other Altova products

Currently, global resources can be defined and used in the following individual Altova products: XMLSpy, StyleVision, MapForce, and DatabaseSpy.

6.1.1 Defining Global Resources

Altova Global Resources are defined in the **Manage Global Resources** dialog, which can be accessed in two ways:

- Click Tools in the menu bar to pop up the **Tools** menu (*screenshot below*), and select the command **Global Resources**.

This pops up the **Manage Global Resources** dialog.

- Click the **Manage Global Resources**  icon in the Global Resources toolbar. This pops up the **Manage Global Resources** dialog.

The Global Resources XML File

Information about global resources that you define is stored in an XML file. By default, this XML file is called `GlobalResources.xml`, and it is stored in the `\Altova\` sub-folder of the [\(My\) Documents](#) folder. This file is set as the default Global Resources XML File for all Altova applications. As a result, a global resource defined in any application will be available to all Altova applications—assuming that all applications use this file.

You can also re-name the file and save it to any location, if you wish. Consequently, you may have multiple Global Resources XML files. However, only one of these Global Resources XML File can be active at any time, and only the definitions contained in this file will be available to the application.

To select a Global Resources XML file to be the active file, in the Manage Global Resources dialog (*screenshot below*), browse for it in the Definitions File entry and select it.

Managing global resources: adding, editing, deleting

In the Manage Global Resources dialog (*screenshot above*), you can add a global resource to the selected Global Resources XML File, or edit or delete a selected global resource. The Global Resources XML File organizes the aliases you add into a list of several sections: files, folders, and databases (*see screenshot above*).

To add a global resource, click the **Add** button and define the global resource in the **Global Resource** dialog that pops up (*see description below*). After you define a global resource and save it, the global resource (or alias) is added to the library of global definitions in the selected Global Resources XML File. To edit a global resource, select it and click **Edit**. This pops up the **Global Resource** dialog, in which you can make the necessary changes (see the descriptions of [files](#), [folders](#), and [databases](#) in the sub-sections of this section). To delete a global resource, select it and click **Delete**. If the global resource you delete has been added as a data source to the project that is currently open in DatabaseSpy, a message box appears and you can decide whether the data source should be deleted also in the project or whether it should be converted into a local data source.

After you finish adding, editing, or deleting, make sure to click **OK** in the **Manage Global Resources** dialog to save your modifications to the Global Resources XML File.

Adding a global resource

Creating a global resource involves mapping one alias name to one or more resources (file, folder, or database). Each mapping is called a configuration. A single alias name can therefore be associated with several resources via different configurations (*screenshot below*).

In the **Manage Global Resources** dialog (*screenshot above*), when you click the **Add** button, you can select whether you wish to add a file-type, folder-type, or database-type resource. How to add and edit each type of resource is described in the sub-sections of this section.

Files

In the **Global Resource** dialog for Files (*screenshot below*), you can add a file resource as follows:

To define a file-type global resource:

1. Enter an alias name.
2. The Configurations pane will have a configuration named Default (*screenshot above*). This Default configuration cannot be deleted nor have its name changed. You can enter as many additional configurations for the selected alias as you like. Add a configuration by clicking the **Add Configuration** icon  and, in the **Add Configuration** dialog which pops up, enter the configuration name. Click **OK**. The new configuration will be listed in the Configurations pane. Repeat for as many configurations as required for this

- particular alias (global resource). You can also copy a configuration (using the Add Configuration as Copy icon) and then modify it.
3. Select one of the configurations in the Configurations pane and then define the resource to which this configuration will map. In the Settings for Configuration X pane, select the 'File' radio button.
 4. Specify a resource for each configuration (that is, repeat Step 3 above for the various configurations you have created).
 5. Click **OK** in the **Global Resource** dialog to save the alias and all its configurations as a global resource. The global resource will be listed under Files in the **Manage Global Resources** dialog.

Folders

In the **Global Resource** dialog for Folders (*screenshot below*), you can add a folder resource as follows:

To define a folder-type global resource:

1. Enter an alias name.
2. The Configurations pane will have a configuration named Default (*screenshot above*). This Default configuration cannot be deleted nor have its name changed. You can enter as many additional configurations for the selected alias as you like. Add a configuration by clicking the **Add Configuration** icon  and, in the **Add Configuration** dialog which pops up, enter the configuration name. Click **OK**. The new configuration will be listed in the Configurations pane. Repeat for as many configurations as required for this particular alias (global resource).
3. Select one of the configurations in the Configurations pane and browse for the folder you wish to create as a global resource.
4. Specify a folder resource for each configuration (that is, repeat Step 3 above for the various configurations you have created).
5. Click **OK** in the **Global Resource** dialog to save the alias and all its configurations as a global resource. The global resource will be listed under Folders in the **Manage Global Resources** dialog.

Databases

In the **Global Resource** dialog for Databases (*screenshot below*), you can add a database resource as follows:

To define a database-type global resource:

1. Enter an alias name.
2. The Configurations pane will have a configuration named Default (*screenshot above*). This Default configuration cannot be deleted nor have its name changed. You can enter as many additional configurations for the selected alias as you like. Add a configuration by clicking the **Add Configuration** icon  and, in the **Add Configuration** dialog which pops up, enter the configuration name. Click **OK**. The new configuration will be listed in the Configurations pane. Repeat for as many configurations as required for this particular alias (global resource).
3. Select one of the configurations in the Configurations pane and click the **Choose Database** icon. This pops up the **Create Global Resources Connection** dialog (*screenshot below*).

4. Select whether you wish to create a connection to the database using the Connection Wizard, an ADO Connection, or an ODBC Connection. Complete the definition of the connection method as described in the section [Connecting to a Database](#). You can use either the [Connection Wizard](#), [ADO Connections](#), or [ODBC Connections](#).
5. Optionally, select a root object in the **Choose Root Object** dialog and click **Set Root Object** if only one root object should be available in the applications where the global resource is used.

- Click the **Skip** button if all root objects should be available in the applications. In the latter case, the user will have to choose the appropriate root object in the respective Altova application when the global resource is used.
6. Specify a database resource for each configuration (that is, repeat Steps 3 and 4 above for the various configurations you have created).
 7. Click **OK** in the **Global Resource** dialog to save the alias and all its configurations as a global resource. The global resource will be listed under databases in the **Manage Global Resources** dialog.

Copying Configurations

The **Manage Global Resources** dialog allows you to duplicate existing configurations for all types of resources. To do so, select a configuration and click the **Copy Configuration** icon . Then select or enter a configuration name and click **OK**. This creates a copy of the selected configuration which you can now change as required.

6.1.2 Using Global Resources

There are several types of global resources (file-type, folder-type, and database-type). The various scenarios in which you can use global resources in DatabaseSpy are listed in this section: [Global SQL Statements](#) and [Data Sources in DatabaseSpy Projects](#).

Selections that determine which resource is used

There are two application-wide selections that determine what global resources can be used and which global resources are actually used at any given time:

- *The active Global Resources XML File* is selected in the [Global Resource dialog](#). The global-resource definitions that are present in the active Global Resources XML File are available in the application. Only the definitions in the active Global Resources XML File are available. The active Global Resources XML File can be changed at any time, and the global-resource definitions in the new active file will immediately replace those of the previously active file. The active Global Resources XML File therefore determines: (i) what global resources can be assigned, and (ii) what global resources are available for look-up (for example, if a global resource in one Global Resource XML File is assigned but there is no global resource of that name in the currently active Global Resources XML File, then the assigned global resource (alias) cannot be looked up).
- *The active configuration* is selected via the menu item [Tools | Active Configuration](#) or via the Global Resources toolbar. Clicking this command (or drop-down list in the toolbar) pops up a list of configurations across all aliases. Selecting a configuration makes that configuration active application-wide. This means that wherever a global resource (or alias) is used, the resource corresponding to the active configuration of each used alias will be loaded. The active configuration is applied to all used aliases. If an alias does not have a configuration with the name of the active configuration, then the default configuration of that alias will be used.

Global SQL Statements

SQL statements that have been saved as *.SQL files can be used as [file-type global resources](#) in DatabaseSpy. For example, if you use a development and a production database with different names and/or location, you would need two different SQL statements to query the currently active database. By defining these SQL statements as global resources, you can not only switch between the two databases with a mouse click, but also have the corresponding SQL query displayed in the SQL Editor. All you have to do, is to synchronize the SQL Editor with the data source and execute the query.

Displaying file-type global resources in the SQL Editor

File-type global resources can be viewed, edited, and executed like any other SQL in the SQL Editor. When clicking the **View** button in the **Manage Global Resources** dialog, the file is displayed in the SQL Editor in the background and the **Manage Global Resources** dialog remains open so that you can edit or delete the global resource, if required.

Alternatively you can also use the **File** menu to open a global resource.

To display a file-type global resource in the SQL Editor:

1. Select the menu option **File | Open Global Resource...** to display the **Choose Global Resource** dialog box.
2. Select a file-type global resource under the Files directory and click **OK**. The file is displayed under its Alias name in a new SQL Editor window.

Alternatively, do the following:

1. Select the menu option **Tools | Global Resources...** or click the **Manage Global Resources**  toolbar button to open the **Manage Global Resources** dialog.
2. In the Files folder, select the Alias name of the SQL file you want to display and click the **View** button.
3. Click **Cancel** to close the **Manage Global Resources** dialog.

Data Sources in DatabaseSpy Projects

When working with DatabaseSpy, you can make use of [database-type global resources](#) in several ways:

- Add a global resource to a project as a data source
- Convert an existing data source connection to a global resource
- Copy a global resource into a project (and thus make it a local data source connection)

Adding a data source connection from a global resource

You can add a data source from a global resource either via the **File | Create a Database Connection...** menu or by right-clicking the Data Sources folder in the Project window and choosing **Add a New Data source** from the context menu. Both options bring up the **Create a**

Database Connection dialog, where you can choose a global resource from the Global Resources page.

Note that a balloon help pops up when you hover over the individual entries, showing information about the different configurations in the global resource.

Converting an existing data source connection to a global resource

Any data source connection that appears in a DatabaseSpy project can be converted to a global resource with a single mouse click.

The data source is added to the Global Resources XML file and hence available in all Altova applications. Note that the icon in the Project window changes to indicate that the data source connection is now a global resource.

When you right-click the Data Sources folder in the Project window, you also have the option to convert all data sources in the project to global resources.

Copying a global resource into a project

If you want to use only a certain configuration of a global resource, you can add the global resource to your project, then copy it to the project as a local data source connection and remove the global resource from the project again. Make sure that you have selected the appropriate configuration before copying the global resource into the project. Only the active configuration will be available once the data source is local.

To copy a global resource into a project:

1. In the Project window, right-click a data source that has been added to the project as global resource and select **Copy Global Resource into Project** from the context menu.
2. Enter a name in the **Set a Data Source Name** dialog and click **OK**.
3. Optionally, remove the global resource from the project.

Changing Configurations

One global resource configuration can be active at any time, and it is active application-wide. This means that the active configuration is active for all aliases in all currently open files and data source connections. If an alias does not have a configuration with the name of the active configuration, then the default configuration of that alias will be used.

As an example of how to change configurations, consider the case in which a database migration is tested before going live. The data source connection and the SQL queries can be switched merely by changing the configuration of the global resource. This can be done in two ways:

- When you hover over the menu command **Tools | Active Configuration**, a submenu with a list of all configurations in the Global Resources XML File pops out. Select the required configuration.
- In the combo box of the Global Resources toolbar (*screenshot below*), select the required configuration.

DatabaseSpy displays a dialog where you can choose whether or not the files and/or data source connections should be reloaded.

In this way, by changing the active configuration, you can change source files that are assigned via a global resource.

6.2 Connecting to a Database

The easiest way to connect to a database in DatabaseSpy is using the **Add a Data Source** dialog box. When you start DatabaseSpy for the first time, this dialog box pops up automatically. The **Add a Data Source** dialog box allows you to create a connection to a data source, add the data source connection to a DatabaseSpy Project, and connect to it. Furthermore, you can open a DatabaseSpy Project, or make use of Altova's global resources which can be used across a range of Altova products.

All data source connections in DatabaseSpy are maintained in DatabaseSpy Projects, that is, as soon as you establish a connection to a data source, this connection is either added to the currently active project, or a new project with this connection is created. Projects can also be opened using the **File** menu and you can also use the context menu to add a new data source to a project.

The **Add a Data Source** dialog box provides the following options:

- Create connections to a data source with the aid of the [Connection Wizard](#)
- Create new [ADO Connections](#)
- Create new [ODBC Connections](#) or use [existing System DSNs, User DSNs, or File DSNs](#) to connect to a data source
- Use a data source connections stored in existing [Global Resources](#)

Starting DatabaseSpy initially creates a new project and opens the **Add a Data Source** dialog box unless you have deactivated this option in the [General options](#). Alternatively, you can open the **Add a Data Source** dialog box at any time by choosing **File | Create a Database**

Connection... from the menu or pressing **Ctrl+Q**. A toolbar icon  is also provided in the Standard toolbar.

Please note: When you create new connection to a data source in the **Add a Data Source** dialog box, this connection will automatically be added to the currently open project.

6.2.1 Using the Connection Wizard

The Connection Wizard simplifies the choices needed to connect to a database and proposes a number of preferred connection types. It allows you to quickly create connections to any of the database types in the list.

The following procedure explains how to use the Connection Wizard.

To use the Connection Wizard for creating connections:

1. Select the menu option **File | Create a Database Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon in the Standard toolbar. The **Add a Data Source** dialog box appears.
2. Click the **Connection Wizard**  icon.
3. See the respective sections below on how to create a connection to a particular database.

How to Connect to Access

1. [Open the Connection Wizard](#) and select the `Microsoft Access ( ADO )` radio button.
2. Click **Next** and enter the path to an Access database or click the **Browse** button to locate an Access database in your file system.
3. Click **Connect** to open the **Set A Data Source Name** dialog box.
Enter the name of the new connection and click **OK** to confirm.
The new connection is displayed in the Project tab and is automatically activated.

Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

How to Connect to SQLServer

1. [Open the Connection Wizard](#) and select the `Microsoft SQLServer ( ADO )` radio button.

2. Click **Next** and select a provider in the **Connecting to MS SQL Server** screen.
You can skip this step in future connection setups and always use the same provider if you activate the `Skip the configuration step for wizard` check box. This page is not visible if you have activated the `Skip Configuration Step` in Connection Wizard in the [General options](#).
3. Click **Next** to open the Connection tab of SQL Server's **Data Link Properties** dialog box.
Depending on the provider you have selected in step 1, the information you have to enter may differ slightly.
4. Enter the server name or data source location, respectively.
5. Select either `Use Windows NT Integrated security` if you want to use your Windows log-on information for logging on to the server, or choose `Use a specific user name and password`, enter the user name and password, and activate the `Allow saving password` check box.
6. Enter the name of the database that is to be used as a root object, or select it from the drop-down list, if available. When using "Microsoft OLE DB Provider for SQL Server", you can also browse to a database file.
7. Optionally, click **Test Connection**.
8. Click **OK** to open the **Set A Data Source Name** dialog box.
Enter the name of the new connection and click **OK** to confirm.
The new connection is displayed in the Project tab and is automatically activated.

Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

How to Connect to Oracle

1. [Open the Connection Wizard](#) and select the `Oracle ( ODBC)` radio button.
2. Click **Next** to display the **Connecting to Oracle** screen.
You can skip this step in future connection setups and always use the same provider if you activate the `Skip the configuration step for wizard` check box. This page is not visible if you have activated the `Skip Configuration Step` in Connection Wizard in the [General options](#).
3. Do one of the following:
 - Create a new data source name.
 1. Choose the `Create a new Data Source Name ( DSN)` with the `driver` radio button, select a driver from the drop-down list.
If no drivers are listed in the drop-down list, or if the desired driver is not included in the list, optionally click the **Where can I find <database type> drivers?** button to display information on how to find an ODBC driver for your database.
 2. Optionally, if a desired driver does not appear in the selection list, do the following:
 1. Click the **Edit Drivers** button.
 2. Activate the desired drivers in the list box, or deactivate drivers that you want to remove from the selection list.
You can sort the drivers list by name or by activation status by clicking the

respective column header. Clicking a header once will sort the list ascending, clicking a second time, descending.

3. Click the **Back** button.
3. Click **Next** and enter data source name, an optional description, user name and password (if required), and server or TNS service name, respectively.
Depending on the driver you have selected in step 1, the information you have to enter may differ slightly.
4. Optionally, click **Test Connection**.
5. Click **OK**.
- Use an existing data source name.
 1. Choose the `Use an existing Data Source Name` radio button.
 2. Select either the `User DSN` or the `System DSN` radio button.
 3. Select a data source from the list and click **Next**.
4. Enter the password and click **OK**.

In the **How Do You Want the Data Source to Communicate with the Server?** dialog box, choose either `Natively` or `Via the ODBC API`.

5. Click **OK** to open the **Set A Data Source Name** dialog box.
Enter the name of the new connection and click **OK** to confirm.
The new connection is displayed in the Project tab and is automatically activated.

Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

How to Connect to MySQL

1. [Open the Connection Wizard](#) and select the `MySQL ( ODBC )` radio button.
2. Click **Next** to display the **Connecting to MySQL** screen.
You can skip this step in future connection setups and always use the same provider if you activate the `Skip the configuration step for wizard` check box. This page is not visible if you have activated the `Skip Configuration Step` in Connection Wizard in the [General options](#).
3. Do one of the following:
 - Create a new data source name.
 1. Choose the `Create a new Data Source Name ( DSN )` with the `driver` radio button, select a driver from the drop-down list.
If no drivers are listed in the drop-down list, or if the desired driver is not included in the list, optionally click the **Where can I find <database type> drivers?** button to display information on how to find an ODBC driver for your database.
 2. Optionally, if a desired driver does not appear in the selection list, do the following:
 1. Click the **Edit Drivers** button.
 2. Activate the desired drivers in the list box, or deactivate drivers that you want to remove from the selection list.
You can sort the drivers list by name or by activation status by clicking the

respective column header. Clicking a header once will sort the list ascending, clicking a second time, descending.

3. Click the **Back** button.
3. Click **Next** and enter data source name, an optional description, user name and password (if required), and server or TNS service name, respectively. Depending on the driver you have selected in step 1, the information you have to enter may differ slightly.
4. Enter the password and select a database from the drop-down list.
5. Optionally, click **Test**.
- Use an existing data source name.
 1. Choose the `Use an existing Data Source Name` radio button.
 2. Select either the `User DSN` or the `System DSN` radio button.
 3. Select a data source from the list and click **Next**.
4. Click **OK**.

In the **How Do You Want the Data Source to Communicate with the Server?** dialog box, choose either `Natively` or `Via the ODBC API`.

5. Click **OK** to open the **Set A Data Source Name** dialog box.
Enter the name of the new connection and click **OK** to confirm.
The new connection is displayed in the Project tab and is automatically activated.

Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

How to Connect to DB2

To be able to establish a connection to a DB2 database, you must first create a database alias. This can be done in IBM's Control Center which has been installed with the database client for DB2. Please consult the respective IBM DB2 Control Center help files if you need assistance when creating an alias.

1. [Open the Connection Wizard](#) and select the `IBM DB2 ( ODBC )` radio button.
2. Click **Next** to display the **Connecting to IBM DB2** screen.
You can skip this step in future connection setups and always use the same provider if you activate the `Skip the configuration step for wizard` check box. This page is not visible if you have activated the `Skip Configuration Step` in Connection Wizard in the [General options](#).
3. Do one of the following:
 - Create a new data source name.
 1. Choose the `Create a new Data Source Name ( DSN )` with the `driver` radio button, select a driver from the drop-down list.
 2. Optionally, if a desired driver does not appear in the selection list, do the following:
 1. Click the **Edit Drivers** button.
 2. Activate the desired drivers in the list box, or deactivate drivers that you want to

remove from the selection list.

You can sort the drivers list by name or by activation status by clicking the respective column header. Clicking a header once will sort the list ascending, clicking a second time, descending.

3. Click the **Back** button.

3. Click **Next** and choose a database alias from the drop-down list.

4. Enter a data source name and an optional description, and click **OK**.

- Use an existing data source name.

1. Choose the `Use an existing Data Source Name` radio button.

2. Select either the User DSN or the System DSN radio button.

3. Select a data source from the list and click **Next**.

4. In the **Connect To DB2 Database** dialog box, enter user ID and password and select the connection mode.

5. Click **OK**.

In the **How Do You Want the Data Source to Communicate with the Server?** dialog box, choose either `Natively` or `Via the ODBC API`.

6. Click **OK** to open the **Set A Data Source Name** dialog box.

Enter the name of the new connection and click **OK** to confirm.

The new connection is displayed in the Project tab and is automatically activated.

Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

How to Connect to Sybase

1. [Open the Connection Wizard](#) and select the `Sybase ( ODBC )` radio button.

2. Click **Next** to display the **Connecting to Sybase** screen.

You can skip this step in future connection setups and always use the same provider if you activate the `Skip the configuration step for wizard` check box. This page is not visible if you have activated the `Skip Configuration Step` in Connection Wizard in the [General options](#).

3. Do one of the following:

- Create a new data source name.

1. Choose the `Create a new Data Source Name ( DSN )` with the `driver` radio button, select a driver from the drop-down list and click **Next**.

2. Optionally, if a desired driver does not appear in the selection list, do the following:

1. Click the **Edit Drivers** button.

2. Activate the desired drivers in the list box, or deactivate drivers that you want to remove from the selection list.

You can sort the drivers list by name or by activation status by clicking the respective column header. Clicking a header once will sort the list ascending, clicking a second time, descending.

3. Click the **Back** button.

3. Enter data source name, an optional description, choose a network library name.
 4. Enter the network address: For Winsock type "<servername or IP address>,
<port number>", and for NamedPipes enter the pipe address.
 5. Enter the database name of the database you want to connect to.
Depending on the provider you have selected in step 1, the information you have to enter may differ slightly.
 6. Optionally, click **Test Connect**.
 7. Click **OK**.
 8. In the **Logon to Sybase** dialog box, enter Login Id and password and click **OK**.
- Use an existing data source name.
 1. Choose the `Use an existing Data Source Name` radio button.
 2. Select either the User DSN or the System DSN radio button.
 3. Select a data source from the list and click **Next**.
 - 4. In the **Logon to Sybase** dialog box, enter Login ID and password.
 - 5. Click **OK**.

In the **How Do You Want the Data Source to Communicate with the Server?** dialog box, choose either `Natively` or `Via the ODBC API`.

6. Click **OK** to open the **Set A Data Source Name** dialog box.
Enter the name of the new connection and click **OK** to confirm.
The new connection is displayed in the Project tab and is automatically activated.

Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

How to Connect to PostgreSQL

1. [Open the Connection Wizard](#) and select the `PostgreSQL ( ODBC )` radio button.
2. Click **Next** to display the **Connect to PostgreSQL** screen.
You can skip this step in future connection setups and always use the same provider if you activate the `Skip the configuration step for wizard` check box. This page is not visible if you have activated the `Skip Configuration Step` in Connection Wizard in the [General options](#).
3. Do one of the following:
 - Create a new data source name.
 1. Choose the `Create a new Data Source Name ( DSN )` with the `driver` radio button, select a driver from the drop-down list.
If no drivers are listed in the drop-down list, or if the desired driver is not included in the list, optionally click the **Where can I find <database type> drivers?** button to display information on how to find an ODBC driver for your database.
 2. Optionally, if a desired driver does not appear in the selection list, do the following:
 1. Click the **Edit Drivers** button.

2. Activate the desired drivers in the list box, or deactivate drivers that you want to remove from the selection list.
You can sort the drivers list by name or by activation status by clicking the respective column header. Clicking a header once will sort the list ascending, clicking a second time, descending.
 3. Click the **Back** button.
 3. Click **Next** and enter data source name, an optional description, user name and password (if required), and server or TNS service name, respectively.
Depending on the driver you have selected in step 1, the information you have to enter may differ slightly.
 4. Enter the database you want to connect to.
 5. Choose the desired SSL Mode from the drop-down list and enter the port.
 6. Optionally, click the **Data source** button and change the advanced options.
 7. Optionally, click the **Global** button and change the global settings.
 8. Optionally, click **Test**.
 9. Click **Save**.
- Use an existing data source name.
 1. Choose the `Use an existing Data Source Name` radio button.
 2. Select either the User DSN or the System DSN radio button.
 3. Select a data source from the list and click **Next**.

In the **How Do You Want the Data Source to Communicate with the Server?** dialog box, choose either `Natively` or `Via the ODBC API`.

4. Click OK to open the **Set A Data Source Name** dialog box.
Enter the name of the new connection and click **OK** to confirm.
The new connection is displayed in the Project tab and is automatically activated.

Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

6.2.2 Creating an ADO Connection

An ADO (ActiveX Data Objects) connection can be created without carrying out any preliminary steps, such as [creating a DSN](#). Always use an ADO connection for MS Access databases, as ODBC does not support relationships.

The following procedure explains how to create an ADO connection, using Microsoft SQL Server as an example.

For an ADO connection to MS SQL Server via the driver SQL Server Native Client 10.0 the following property values must be set in the *All* tab of the Data Link Properties dialog: (i) Set the property value of Integrated Security to a space character; (ii) Set the property value of Persist Security Info to `true`.

To create an ADO connection:

1. Select the menu option **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon in the Standard toolbar. The **Add a Data Source** dialog box appears.
2. Click the **ADO Connections**  icon.
3. Click the **Build** button. The Provider tab of the **Data Link Properties** dialog box opens.

4. Select **Microsoft OLE DB Provider for SQL Server** from the drop-down list and click **Next**. The Connection tab appears.

5. Enter a server name or select it from the drop-down list.
Click the **Refresh** button to refresh the list of available server names, if required.
6. Do one of the following:
 - Select **Use Windows NT Integrated security**.
 - Select **Use a specific user name and password**, enter the user name and password, and select the **Allow saving password** check box.
7. Select the database from the drop-down list.
8. Optionally, click **Test Connection**.
9. Click **OK**.
The **Data Link Properties** dialog box closes. The connection string appears in the **Add a Data Source** dialog box.
10. Click **Connect** to open the **Set a Data Source Name** dialog box.
11. Enter the name of the new connection and click **OK** to confirm. You may be prompted for a user name and password or for the data source to connect to.
The new connection is displayed in the Project tab and is automatically activated.
12. Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

Important note: If you use "SQL Server Native Client 10.0" as a driver for your ADO connection, make sure that the `Integrated Security` property is set to a space character

and that the `Persist Security Info` property is set to "True" on the All tab of the **Data Link Properties** dialog box.

Connecting to an Access Database

When you connect to an Access database in DatabaseSpy, in addition to your user name and password, you may also have to specify the workgroup information file for the database in order to be able to connect to the database. Please note that in this case you cannot use the Connection Wizard to connect.

To connect to an Access database using a user in a workgroup:

1. Select the menu option **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon in the Standard toolbar. The **Add a Data Source** dialog box appears.
2. Click the **ADO Connections**  icon.
3. Click the **Build** button. The **Provider** tab of the **Data Link Properties** dialog box opens.
4. Select **Microsoft Jet 4.0 OLE DB Provider** from the drop-down list and click **Next**. The **Connection** tab appears.
5. Enter a database name or click the  button to browse to the database.
6. Enter the user name and password, and select the `Allow saving password` check

box.

7. Click the All tab and select the `Jet OLEDB: System database` entry.
8. Click the **Edit Value...** button and enter the path to the Workgroup Information file.

9. Click **OK**.
10. Optionally, click the Connection tab and click the **Test Connection** button to see if the connection details have been entered correctly.
11. Click **OK**.

The **Data Link Properties** dialog box closes. The connection string appears in the **Add a Data Source** dialog.

12. Click **Connect** to open the **Set a Data Source Name** page.
13. Enter the name of the new connection and click **OK** to confirm. You may be prompted for a user name and password or for the data source to connect to. The new connection is displayed in the Project tab and is automatically activated.
14. Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

To connect to a password-protected Access database:

1. Select the menu option **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon in the Standard toolbar. The **Add a Data Source** dialog box appears.
2. Click the **ADO Connections** icon.
3. Click the **Build** button. The Provider tab of the **Data Link Properties** dialog box opens.
4. Select `Microsoft Jet 4.0 OLE DB Provider` from the drop-down list and click **Next**. The Connection tab appears.
5. Enter a server database name or click the  button to browse to the database.
6. Click the All tab and select the `Jet OLEDB: Database Password` entry.
7. Click the **Edit Value...** button and enter the database password.

8. Click **OK**.
9. Optionally, click the Connection tab and click the **Test Connection** button to see if the connection details have been entered correctly.
10. Click **OK**.

The **Data Link Properties** dialog box closes. The connection string appears in the **Add a Data Source** dialog box.
11. Click **Connect** to open the **Set a Data Source Name** page.
12. Enter the name of the new connection and click **OK** to confirm. You may be prompted for a user name and password or for the data source to connect to.

The new connection is displayed in the Project tab and is automatically activated.
13. Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

6.2.3 Creating an ODBC Connection

When using the ODBC (Open Database Connectivity) type of connection, you can choose from among the following DSN (data source name) modes:

- System DSN: This type of DSN can be used by anyone who has access to the computer. DSN information is stored in the registry.
- User DSN: This type of DSN is created for a specific user and is also stored in the registry.
- File DSN: For this type of DSN, DSN information is stored in a text file with DSN extension.

Please note: In order to create an ODBC connection in DatabaseSpy, you must first [create a DSN](#). The list box of the ODBC Connections page contains all the existing DSNs that have already been created earlier.

When you choose either the `System DSN` or the `User DSN` radio button, several icons are available at the bottom of the dialog box which can be used to create new or maintain existing DSNs:

Create a new DSN: Opens the **Create an ODBC DSN** dialog box where you can select a driver and choose the desired DSN mode (user or system DSN) to [create a new DSN](#).

Edit selected DSN: Allows you to change the settings of the selected DSN.

Remove selected DSN: Removes the selected DSN from the data source list.

Refresh listed DSNs: Updates the data source list.

To connect to an existing DSN:

1. Select the menu option **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon in the Standard toolbar. The **Add a Data Source** dialog box appears.
2. Click the **ODBC Connections**  icon.
3. Select one of the following:
 - System DSN
 - User DSN
 The available DSNs in the selected category appear.
 - File DSN
 Select a folder which contains the File DSNs.

4. Select the desired data source name.
5. Click **Connect** to open the **Set a Data Source Name** dialog page.
6. Enter the name of the new connection and click **OK** to confirm. You may be prompted for a user name and password or for the data source to connect to. The new connection is displayed in the Project tab and is automatically activated.
7. Click the **Save Project**  button, or press **Ctrl+S**, or select the menu option **File | Save | Save Project** to save the project.

To create a new user DSN or system DSN:

1. Select the menu option **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon in the Standard toolbar. The **Add a Data Source** dialog box appears.
2. Click the **ODBC Connections**  icon and click the **Create a new DSN button**  at the bottom of the dialog box.
3. In the **Create an ODBC DSN** dialog box, select a driver from the drop-down list and select either the **User DSN** or the **System DSN** button.
4. Enter the data required for the selected data source connection. The amount of data that has to be entered depends on the database driver you have selected from the drop-down list in step 3.

Creating a DSN (Data Source Name)

Before you [create an ODBC connection](#), you might have to create a data source name (DSN) for the data source you want to connect to. The DSN contains all the relevant data that enables the database driver to connect to the database. The following types of DSN can be created in DatabaseSpy:

- **System DSN:** This data source name is stored in the registry and can be used by any user on that computer.
- **User DSN:** The use of this data source name is limited to a particular user; it is also stored in the registry.
- **File DSN:** All relevant information is stored within a text file (extension *.DSN). Users of different computers who have the same drivers installed can use the file.

What the creation of a DSN looks like, depends on which type of DSN you are creating and which type of database you are connecting to. The following procedure explains how to create a user DSN for Microsoft SQL Server. Note that the same procedure has to be followed when creating a system DSN.

To create a user DSN for Microsoft SQL Server:

1. Select the menu option **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon in the Standard toolbar. The **Add a Data Source** dialog box appears.
2. Click the **ODBC Connections**  icon and click the **Create a new DSN button**  at the bottom of the dialog box.
3. In the **Create an ODBC DSN** dialog box, select "SQL Native Client" from the drop-down list.
4. Click the **User DSN** button. The **Create a New Data Source to SQL Server** dialog box

appears.

5. Type in the name under which you want to save the DSN, and a description of the data source. Select the server from the combo box. Click **Next**.

6. Select the kind of authentication you want to use when connecting to this MS SQL server:
 - Integrated Windows authentication

- SQL Server authentication: In this case, you also have to select the check box and enter your **Login ID** and **Password**.

Click **Next**.

7. Change the default database to the database you would like to connect to on this server when you make the connection active in DatabaseSpy. Click **Next**.
8. Optionally change the language, encryption, and regional settings options or specify paths for log files.
9. Click **Finish**. A summary of the settings of the newly created data source is presented in the **ODBC Microsoft Server Setup** dialog box. Optionally, click the **Test Data Source...** button.
10. Click **OK**. The new DSN appears in the Data Source list in the **Add a Data Source** dialog box.

Data Source	Driver
MS Access Database	Microsoft Access Driver (*.mdb)
Excel Files	Microsoft Excel Driver (*.xls)
dBASE Files	Microsoft dBase Driver (*.dbf)
ZooDB on TS-SQL	SQL Native Client
DBSpy on DB2	IBM DB2 ODBC DRIVER - DB2COPY1
ZooDB	SQL Native Client

Building a Connection String for ODBC

Once you have [created a new DSN](#), you must create a connection string in order to be able to use this DSN for the connection to a data source.

To build a connection string:

1. Select the menu option **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or

click the **Connect to a database**  icon in the Standard toolbar.
The **Add a Data Source** dialog box appears.

2. Click the **ODBC Connections** icon and select the `Build a connection string` radio button.
3. Click **Build**.
The **Select Data Source** dialog box appears.

4. Do one of the following:
 - Select the **File Data Source** tab, choose a folder, and select a file DSN from the list.
 - Select the **Machine Data Source** tab and select a user or system DSN from the list.
 - Click **New** in either of the two tabs to [create a new DSN](#).
5. Click **OK**.
You may be prompted for a user name and password.
6. Click the **Connect** button. You are prompted for the Connection name, the connection is added to the currently open project and made active.

6.2.4 Creating a JDBC Connection

This section describes how to connect to a DB via JDBC. The steps listed below describe a connection to an IBM DB2 database, but they apply also to other types of databases that can be connected to via JDBC.

Pre-connection steps

Before connecting to the DB via JDBC, you must do the following:

1. Ensure that the Java Runtime Environment (JRE) is installed. If it isn't installed, then install it. Use a 32-bit JRE for a 32-bit machine or a 64-bit JRE for a 64-bit machine.
2. Install a JDBC driver. No special installation setup is required. All you need to do is copy the driver to a local directory, for example, `c:\jdbc`. Note that JDBC drivers (which are Jar files) are platform-independent.
3. Set up the `CLASSPATH` to include the location where the JDBC driver is located. (The application reads the `CLASSPATH` environment variable to locate the JDBC driver.) To access and edit the `CLASSPATH`, do the following: Click **Start | Control Panel | System | Advanced | Environment Variables**. In the Environment Variables dialog that appears, select either the `CLASSPATH` user environment variable or the `CLASSPATH` system environment variable and click the **Edit** button. Add the path to the JDBC driver to the `CLASSPATH`. For example: `CLASSPATH=C:\jdbc\sqljdbc.jar;C:\jdbc\db2jcc.jar;`
4. Log off and then log on again to make the `CLASSPATH` changes active.

Note: Installing the complete IBM DB2 or Oracle client will automatically populate the `CLASSPATH` with the JDBC drivers of the respective packages. For more details, see the summaries below.

Connecting via JDBC

To connect using a JDBC connection, do the following:

1. Open the Add a Data Source dialog by using one of the following methods: Select **File | Create a Data Source Connection...**, or press **Ctrl+Q**, or click the **Connect to a database**  icon.
2. In the Add a Data Source dialog, select **JDBC Connections**. The JDBC Connections pane (*screenshot below*) appears.

3. Select a JDBC driver from the *Driver* dropdown list (all detected drivers, i.e. those in the `CLASSPATH` environment variable, are listed). Enter a connection string in the Database URL text box and a user name and password as required. Given below is the connection string syntax for commonly used databases, each with an example connection string.

Oracle `jdbc:oracle:thin:[ user/password]@//[ host][: port] /SID`
 `jdbc:oracle:thin:@//abcd234/ORA11`

IBM DB2 `jdbc:db2://host_name: port/dbname`
 `jdbc:db2://MyDB2: 50000/boz`

MySQL `jdbc:mysql://host_name: port/dbname`
 `jdbc:mysql://MyDB2: 3306/moz`

MSSQL `jdbc:sqlserver://host: port; databasename=name; user=name; password=Pwd`
 `jdbc:sqlserver://abcd38:1433; databasename=coz`
 `jdbc:sqlserver://Q5; DatabaseName=coz; SelectMethod=Cursor`

PostgreSQL `jdbc:postgresql://host: port/database`

```
jdbc:postgresql://abc993:5432/qanoz
```

Sybase

```
jdbc:sybase:Tds:host:port/dbname
```

```
jdbc:sybase:Tds:abc12:2048/QUE
```

4. Click **Connect** to make the connection. The connection is made.

Step-by-step: MSSQL, MySQL, PostGre, and other non-XML DBs

Given below is a step-by-step guide for connecting to a non-XML DB via JDBC:

1. JDBC JAR files (driver files): Copy the files to any local location. Then add the full path and filename to the Windows `CLASSPATH` variable. For example:
C:\jdbc\sqljdbc.jar; C:\jdbc\db2jcc.jar; .
2. Log off and log on to make the `CLASSPATH` changes active.
3. Start DatabaseSpy and access the Connect to a Data Source dialog.
4. The JDBC Connections pane lists, in the *Driver* dropdown box, the detected JDBC drivers. If the dropdown box is empty, make sure that the file `altovadb.jar` is present in the folder: C:\Program Files\Altova\Common2012\jar.
5. Connect to a database as described in the section *Connecting via JDBC* above.

Step-by-step: Oracle

Given below is a step-by-step guide for connecting to an Oracle DB via JDBC. If you don't need the XML and XDB features of the Oracle DB, follow the instructions in the step-by-step guide for non-XML DBs. The installation folder of the Oracle client is indicated in the steps below by the placeholder: `%ORACLE_HOME%`.

1. Install Oracle client software with OCI and ODBC features enabled. If an Oracle client is already installed check if the two jar files below are present:
`%ORACLE_HOME%\LIB\xmlparserv2.jar`
`%ORACLE_HOME%\RDBMS\jlib\xdb.jar`
2. Add the following files to the Windows `CLASSPATH` environment variable:
`%ORACLE_HOME%\jdbc\lib\ojdbc6.jar`
`%ORACLE_HOME%\LIB\xmlparserv2.jar`
`%ORACLE_HOME%\RDBMS\jlib\xdb.jar`
3. Log off and log on to make the `CLASSPATH` changes active.
4. Start DatabaseSpy and access the Connect to a Data Source dialog.
5. The JDBC Connections pane lists, in the *Driver* dropdown box, the detected JDBC drivers. If the dropdown box is empty, make sure that the file `altovadb.jar` is present in the folder: C:\Program Files\Altova\Common2012\jar.
6. Connect to a database as described in the section *Connecting via JDBC* above.

Step-by-step: IBM DB2

Given below is a step-by-step guide for connecting to an IBM DB2 database via JDBC.

1. If an IBM DB2 client has already been installed, nothing needs to be done since the `CLASSPATH` will have been set by the installation process.
2. If no IBM DB2 client has been installed, add the IBM DB2 JDBC driver jar files

- db2jcc.jar and db2jcc_license_cu.jar to the Windows CLASSPATH. Log off and log on to make the CLASSPATH changes active.
3. Start DatabaseSpy and access the Connect to a Data Source dialog.
 4. The JDBC Connections pane lists, in the *Driver* dropdown box, the detected JDBC drivers. If the dropdown box is empty, make sure that the file altovadb.jar is present in the folder: C:\Program Files\Altova\Common2012\jar.
 5. Connect to a database as described in the section *Connecting via JDBC* above.

Note: When databases are connected to via JDBC, due to insufficient information returned by the drivers: (i) data editing is not possible for tables without a primary key; (ii) Execute for data-editing in SQL Editor will not work.

6.2.5 Selecting a Global Resource

The Global Resources page of the **Add a Data Source** dialog box gives you easy access to all available Global Resources. You can select Global Resources from a list and add them to your project and connect.

When you hover over the individual global resource names in the dialog, a balloon help appears and displays the available [configurations](#) for the selected global resource. Please note that the available global resources are defined by the [active Global Resources XML File](#), that is, if you change the Global Resources XML File in the **Manage Global Resources** dialog box, also the available global resources in the **Add a Data Source** dialog box will change.

6.3 Adding Data Sources

The data sources (i.e., database or database schema, respectively) you want to connect to in DatabaseSpy have to be added to the Data Sources folder in the Project window. DatabaseSpy offers a Connection Wizard for the most commonly used database types and dialog boxes for creating ADO and ODBC connections as well as for choosing an Altova Global Resource. All these options are combined in the **Add a Data Source** dialog box which can be called via the **File** menu, the toolbar, a keyboard shortcut, or a context menu option in the Project window.

To add a data source to your project:

1. Do one of the following:
 - Choose the menu option **File | Create a Database Connection...**
 - Press the keyboard shortcut **Ctrl+Q**.
 - Click the **Connect to a database**  button in the Standard toolbar.

The **Add a Data Source** dialog box opens.

- In the Project window, right-click the Data Sources folder and select **Add a New Data Source...** from the context menu.

The **Add a Data Source** dialog box opens.

2. Choose one of the following buttons on the left side of the dialog box and follow the instructions for the respective connection type:
 - [Connection Wizard](#)
 - [ADO Connections](#)
 - [ODBC Connections](#)
 - [Global Resources](#)

Data source options

When you right-click a data source name in the Project window, you can choose from several options depending on the current state (connected or disconnected) of the data source and whether or not the data source is a global resource. The corresponding keyboard shortcuts are shown to the right of the options if they are available.

Connect	Connects to a data source if it is disconnected.
Disconnect	Disconnects from a data source if it is connected.
Remove	Del Removes a data source from the project.
Rename	F2 Renames a data source. Note that only disconnected data sources can be renamed.
Convert to Global Resource	Converts the data source to an Altova Global Resource and adds a database alias with the data source name to the GlobalResources.xml definition file. If an alias with that name already exists, a warning message will be displayed and the operation will fail.
Copy Global Resource into Project	Generates a copy of the global resource and adds it to the project as stand-alone data source. You will have to specify a name for the new data source. The original global resource remains in the project.
Edit Global Resource...	Opens the Global Resource dialog box where you can edit the configuration of the database alias.

To copy a global resource into a project:

1. In the Project window, right-click a data source that has been added to the project as global resource and select **Copy Global Resource into Project** from the context menu.
2. Enter a name in the **Set a Data Source Name** dialog and click **OK**.
3. Optionally, remove the global resource from the project.

To remove a data source from a project:

Select the data source you want to remove and do one of the following:

- Right-click the data source and choose **Remove** from the context menu.
- Press **Del**.

If the data source is connected, DatabaseSpy displays a warning that removing the data source will close the connection.

Renaming data sources

Data sources in projects can be renamed either in the Properties window or via the context menu directly in the Project window.

Please note: You can only rename data sources that are currently disconnected. Both the **Rename** command in the context menu and the title bar in the Properties window are grayed out for connected data sources.

To rename a data source in a project:

1. Make sure that the data source is disconnected.
2. Select the data source you want to rename and do one of the following:
 - In the Properties window, double-click the title bar.
 - In the Project window, right-click the data source and select **Rename** from the context menu.
 - Press **F2**.
3. Enter the new name and press **Enter**.
4. [Save the project](#).

6.4 Adding Files

You can add existing SQL scripts to your DatabaseSpy Project, or you can save designs, data comparisons, or schema comparisons in files and add them. The Project window provides folders for the different file types and you can define properties (e.g., data source to connect to, execution options for SQL, etc.) on file or folder level. This way, you have all the file that you may need at hand, even if they are stored in different locations. If you need to find the exact path to a file that has been added to a project, DatabaseSpy provides the following context menu option:

- Right-click a file in the Project window and select **Locate File...** from the context menu. DatabaseSpy opens the folder that contains the file in Windows Explorer.

Adding files to the project

Existing files (e.g., advanced SQL Scripts) can be included into a project with a few mouse clicks.

To add files to a project:

1. In the Project window, right-click a folder and select **Add Files to Project...** from the context menu. Alternatively, click the **Add files to the Project**  button in the Project window toolbar. The **Open** dialog appears.
2. Browse for the file that you want to add to the project.
3. Click **Open**. The selected file is added to the corresponding folder of the project.
4. [Save the project file](#).

In addition, you can also save the content of the SQL Editor, Design Editor, Data Comparison or Schema Comparison window to a file and add this file to the project at the same time. For every file that is saved for the first time or under a new name, DatabaseSpy pops up the **Add to Project** dialog box which allows you to also add the file to the project.

The **Add to Project** dialog box also serves as a shortcut to the [General options](#), allowing you to define that newly saved files be always added to the project automatically. In addition, you can also suppress the display of this dialog box in the future.

You can use the **File** menu, the toolbar, or the context menu that opens when you right-click the name tab of an SQL Editor, Design Editor, or Comparison window to save a file.

To save a file:

1. Make the SQL Editor, Design Editor, or Comparison window that contains the script, design, or comparison to be saved the active window and do one of the following:

- Click the **Save**  button in the Standard toolbar.
- Select the menu option **File | Save**.
- Press **Ctrl+S**.
- Right click the naming tab at the bottom of the document window and select **Save...** from the context menu.

The **Save As** dialog box opens.

2. Enter a name for the new file, select a folder and click the **Save** button.

The **Add to Project** dialog box opens (if the dialog box does not pop up, check whether the **Do not show dialog** option is checked in the Newly saved files group box of the [General options](#)).

3. Do one or more of the following:
 - Click the **Add to Project** button to add the file the currently active project.
 - Click **Skip Project** to close the dialog box without adding the file to the project.
 - Activate the **Always add newly saved files to the project** check box.
 - Activate the **Do not ask this question again!** check box to suppress the display of the dialog box in the future.

To add the active file to the project:

1. Make the window that contains the file you want to add to the project the active window.
2. Do one of the following:

- In the Project window, click the **Add the Active File**  icon in the toolbar, or right-click the respective folder and select **Add Active File to Project** from the context menu.
- In the SQL Editor, Design Editor, or Comparison window, right-click the tab at the bottom of the Editor window and select **Add to project** from the context menu. If the file has not been saved yet, the Windows **Save As** dialog box opens where you can enter a name and path for the file.

The file appears below the respective folder in the Project window.

3. [Save the project file](#).

To remove a file from a project:

Do one of the following:

- Right-click the file and select **Remove** from the context menu.
- Select the file and press **Del**.

6.5 Favorites

Frequently used database objects that have been added to your favorites are displayed in the Favorites folder. All options for an individual object are available in the context menu and you can directly open the Online Browser by clicking the arrow to the right of the object name.

Defining favorites

DatabaseSpy's Favorites feature allows you to mark frequently used objects in your project as favorites. These items then show up in the Favorites folder of the Project window and are shown bold in the Online Browser so that you have always quick access to them.

In the Project window, an arrow is shown in the Favorites folder next to the item name. When you click on this arrow, the Online Browser opens with the favorite item selected. Note that you can also add databases and schemas or individual table columns to the Favorites folder.

For every item in the Favorites folder, the relevant options are available in the context menu. For example, you can connect a data source directly from within the favorites folder.

To add items to the Favorites folder:

- In the Online Browser, right-click the respective tables or other database objects and select **Add to/Remove from Favorites (Ctrl+F2)** from the context menu.
- Alternatively, if you have activated the `Enable full row selection` check box in the [Online Browser](#) options, click the favorites icon that appears to the right of a database object if you move the mouse cursor over it in the Online Browser.

The tables or objects are added to the Favorites folder and are shown in bold type in the Online Browser. In addition, the favorites icon beneath the object name appears yellow when full row selection is enabled.

To view only the favorites in the Online Browser:

1. Click the **Favorites**  icon to switch to the favorites view.

Note that the **Favorites** icon is now active and only database objects that are contained in the Favorites folder are displayed in the Online Browser.

2. Click the **Favorites** icon again to switch back to the normal Online Browser view.

To rename database objects in the Favorites folder:

1. Make sure that the corresponding data source of the favorites item is connected.
2. Select the database object you want to rename in the favorites folder and do one of the following:
 - In the Properties window, double-click the title bar.
 - In the Project window, right-click the database object in the favorites folder and select **Rename** from the context menu.
 - Press **F2**.
3. Enter the new name and press **Enter**.
A change script is generated in the Database Structure Change Script window.
4. Execute the change script.

To remove a database object from the Favorites folder:

Do one of the following:

- In the Project tab, right-click the object in the Favorites folder and select **Remove from Favorites (Del)**.
- In the Online Browser, right-click the object in its folder and select **Add to/Remove from Favorites (Ctrl+F2)**.
- When [full row selection](#) is enabled, in the Online Browser, move the mouse cursor over a favorite item and click the yellow favorites item to the right of its name.

To remove all database objects from the Favorites folder:

- In the Project tab, right-click the Favorites folder and select **Remove all Favorites**.

6.6 Renaming and Deleting Objects

You have several options to rename a database object:

- In the Properties window of the Online Browser
- In the Online Browser, by using the context menu
- In the table display of the Design Editor

A change script is generated in the Database Structure Change Script window and must be executed to commit the change to the database. DatabaseSpy checks whether you enter a valid name and displays a tooltip if you choose a name that already exists for an object in the database and ignores the input.

Please note: For MS Access, the names of existing tables or columns cannot be changed. If you try to rename an Access table or column name, DatabaseSpy pops up a warning message and rejects the change.

You can rename the following database objects directly in the Online Browser:

- Tables
- Columns
- Keys
- Check constraints
- Indexes
- Views
Whether or not a view can be renamed, depends on the database kind you are working with. Renaming is not possible for databases such as MS Access, IBM DB2, MySQL 5, or Oracle.
- Stored procedures

To rename a database object:

1. Do one of the following:
 - In the Online Browser, select a database object and press **F2** or double-click its title bar in the Properties window.
 - In the Online Browser, right-click a database object and select **Rename** from the context menu.
 - In a Design Editor window, double-click the title bar of a table or the database object, or right-click and select **Rename Table** or **Rename Column** or **Rename Key** or **Rename Index** or **Rename Check Constraint**, respectively, from the context menu.
2. Change the name as desired and press **Enter**.
The changed database object icon appears to the left of its name.
3. If applicable, click the **Update Change Script**  button to update the change script.
4. In the Database Structure Change Script window, click the **Execute Change Script**  button.

Deleting database objects

In DatabaseSpy's Online Browser, you have several possibilities to delete a database object from a database:

- Right-click a database object and choose **Delete** from the context menu.
- Select a database object and press **Del**.

- Right-click a database object and select **Show in new SQL Editor | Drop** from the context menu.

In a Design Editor window, you can do the following to delete a database object:

- Right-click a database object and choose **Delete selected Objects** from the context menu.
- Select a database object and press **Del**.

All the options mentioned above are also valid if you have selected more than one database object. If you select one or more database objects of a table as well as the table itself and press the **Delete** key in a Design Editor window, DatabaseSpy prompts you to choose whether you want to delete the entire table or only its objects.

In order to actually delete the database object(s) from the database, you have to execute the change script or the SQL statement, respectively.

6.7 Properties

In DatabaseSpy you can view properties by selecting objects in (i) the [Project window](#), (ii) the Online Browser, (iii) the Design Editor, or (iv) the Data or Schema Comparison window. In addition, you can define properties for [designs](#), [SQL files](#), and [comparison files](#) that have been added to a project. The properties are displayed in the Properties window.

Changing a property in the Property Window or in the Design Editor automatically generates an SQL change script which appears in the [Database Structure Change Script window](#) either automatically or after you have clicked the **Update Change Script**  button, depending on how you have configured the [Change Script options](#). Properties that cannot be edited are grayed out.

In the **Online Browser**, properties for all database objects as well as for any active data source connection, its database and/or schema(s) can be viewed in the Properties window. When folders are displayed, clicking a folders shows an overview of the folders content in the Properties window.

The properties that are displayed in the Properties window depend on the database object that is currently selected in the Online Browser, Design Editor, or Comparison window. If an object has child objects, the content of the Properties window changes in accordance with the level to which you expand the object, that is, only properties for expanded items are displayed in the Properties window.

For the data source connection, DatabaseSpy displays the same properties like in the [Project window](#). The properties that are displayed when you click on a database in the Online Browser are for information purposes only and cannot be changed.

Object count

For every database object that contains child objects, an overview section is displayed. This section provides hyperlinks for counting the number of the individual children of the database object as well as a hyperlink for counting all children of the object. Note that the count is retrieved automatically if you expand the object in the Online Browser or show a table in the Design Editor.

To retrieve the number of child objects in the Overview section of the Properties window, you have therefore the following options:

- Click the "Update all Counts" hyperlink to retrieve the count for all child objects.

- Click the "Update Count" hyperlink for an individual database object to retrieve the count for this specific item.

- Show a table in the Design Editor; this automatically retrieves the count for all child objects of the table.

- Right-click a table and select **Expand | Children** from the context menu. This expands all sub-folders of the table in the Online Browser and thus shows the number of child objects in the table properties.
- Expand one or more sub-folders in the Online Browser and then click the table again. The number of items contained in the folder is displayed in the table properties.

Tables

Table properties can be viewed (i) in the Properties window and (ii) to some extent in the table design. If properties are displayed in the Properties window, it makes no difference whether a database object is selected in the Online Browser or in the Design Editor.

The Overview section lists the child objects of the table and you can retrieve the number of the individual children separately. In the Constraints section, you can see at a glance which constraints are defined on which columns for the table. Check Constraints on table level can even be edited in this section. Whereas the General section provides only read-only information, you can enter a new or change an existing description for the table in the Description section.

A table may contain the following sub-folders:

- **Columns**
When you expand the Columns sub-folder under a table in the Online Browser or expand the Columns section in a table design in Design Editor, and select a column, the column properties are displayed in the Properties window. Here you can change the data type and the Nullable property in the General section, or enter a description in the Description section. The remaining sections (Overview and Advanced) are read-only.
- **Constraints**
The constraints properties for check constraints include the name of the table the constraint is assigned to, the expression used for the constraint, and a description. You can change the expression and the description in the Properties window.
- **Keys**
If you select a primary or unique key in the Online Browser or in the Design Editor, the Properties window displays the number of columns that are used to build the key as well as the table the key is assigned to.

For foreign keys, also the referenced tables and columns as well as the action on delete and update are displayed in the properties.
- **Indexes**
Index properties show information such as the number of columns involved, index type, and the column name an index is assigned to. The Options section provides additional read-only information.

Views

In the properties for views, DatabaseSpy displays the number of columns that are included in the view (provided that the object count has been retrieved), and the schema in which the view is defined. The Advanced section shows additional read-only information.

XML Schemas

The only option that you can change directly in the Properties window for XML schemas is the `Decomposition` check box. Any other property is read-only in the Properties window and can only be changed in the [XML Schema management for databases](#) dialog box.

Procedures

For procedures, only the number of parameters and the schema in which the procedure is defined are displayed in the Properties window. If you expand a procedure to show the parameters, you can also display the data type and the direction mode of a parameter in the Properties window. All properties for procedures are read-only.

Functions

The properties displayed for functions include the number of parameters, the schema, the `Deterministic` check box, and the language. If you expand a function to show the parameters, you can also display the data type and the direction mode of a parameter in the Properties window. All properties for functions are read-only.

Please note: The constraints information can only be displayed if all the table's children objects have already been loaded. This can be achieved in one of the following ways:

- by expanding the table in the Online Browser
- by generating an SQL statement for that table in the SQL Editor
- by showing the table in the Design Editor

Changing table properties

All the table and columns properties that can be edited can be changed either in the Properties window of the Online Browser or in the property window in the Design Editor. In the table display in the Design Editor, you can also edit the data type or check or uncheck the `Nullable` check box.

To change the properties of a column:

1. Do one of the following:
 - In the Online Browser, select a column and change its properties in the Properties window of the Online Browser.
 - In a Design Editor window, select a column name, click the ball at the right edge of the table display and change the properties in the property window that appears.

The changed column  icon appears to the left of the column name and the changed table  icon appears to the left of the table name.

2. If applicable, click the **Update Change Script**  button to update the change script.
3. In the Database Structure Change Script window, click the **Execute Change Script**  button.

6.7.1 Project Properties

The project properties are displayed in the [Properties window](#) when you click on an object in the [Project window](#). The properties change dynamically when you click on the individual folders or files in a project and can be edited in the Properties window. Properties that cannot be edited are grayed out. All properties that you define for a folder (or sub-folder) are automatically inherited by the files that are contained in that (sub-)folder. You can, however, break that tie by defining separate properties for individual files or sub-folders.

If you have [defined properties for the different folders](#) in the Project window, any file that you add to your project will inherit these properties from its parent folder. You can change the properties for a file at any time. DatabaseSpy displays properties that deviate from the parent folder's values in bold type. Once you have changed a property of a file, the link between the file's property and its parent folder's property is broken and will also not be restored by choosing the identical value in the file's drop-down list. You can, however, [restore the folder-file](#)

[connection](#) by using the respective command in the context menu.

Example: Let's assume you have defined a sub-folder for SQL Server-related files in your Project window, and that you have set the Database Kind property to "MS SQL Server" for that sub-folder (see screenshot below). Since no properties have been defined for the parent SQL folder, the Database Kind property appears in bold type.

The file SelectHostByYear.sql in the SQL Server folder inherits the properties from the SQL Server folder and the Database Kind property therefore appears in normal font type. However, the Data Source and Root Object properties have been changed and the SQL Editor should require semicolons check box has been activated, and these three properties are displayed in bold type.

If you deactivate the SQL Editor should require semicolons check box again, the property will still be displayed bold although the value is now identical to the parent folder's value (see screenshot below). This indicates that the tie between the folder's properties and the file's properties has been broken and—although currently identical—an individual value has been defined for this property.

Once a property has been changed for an individual file, the tie between the file and its parent folder can only be re-established via the **Restore value to parent's option** context menu command.

To reset a file's properties to its parent folder's options:

1. In the Project window, select the file and right-click the property you want to reset in the Properties window.
2. Choose **Restore value to parent's option** from the context menu.

The file inherits the property from the parent folder again.

For the project itself, the path to the project file and, optionally, a description are displayed in the Properties window.

Data source properties

You can define in the data source properties to automatically connect to the data source when the project is opened. To do so, activate the **Connect on Open Project** check box in the Options section of the data source properties.

If you prefer to view data sources in the Online Browser also when they are not connected, you can activate the **Always show in Online Browser** check box which is also located in the Options section.

The **Global Resource** check box is activated if the data source has been added to the projects as a global resource. Note that this property cannot be changed by deactivating the check box. You must copy the global resource into the project and remove the global resource from the project to convert a global resource into a local one.

The `Use ODBC Native Interface` check box is for advanced users who may wish to retrieve structural information about their databases using the API methods provided from ODBC directly rather than DatabaseSpy's internal SQL queries. This might be desired when the user is experiencing difficulties retrieving data, or feels the application is too slow when retrieving this information. The down side to this approach is that the amount of structural information that the user can retrieve via the ODBC interface is limited.

The Driver Information section lists name, version, issuing company, file name, full path, and date of the driver that is used for the selected data source connection.

You can also manually edit the connection details in the Connection section of the data source properties but keep in mind that a project might not be able to establish a connection to the data source if the connection properties have been manipulated. For security reasons, the password for the data source connection cannot be edited directly in the Properties. If you double-click into the `Password` field, an extra dialog box opens where you have to enter the existing password before you can define and confirm a new password.

Detailed [properties of the individual database objects](#) can be viewed by selecting the respective database object in the Online Browser. You must connect to a data source before you can view its database objects in the Online Browser.

SQL folder properties

When you select the SQL folder in the Project window, you can edit the properties that apply to the entire folder and are inherited by all files contained in this folder. These properties can be overridden by properties that you define on file or sub-folder level.

The General section provides three drop-down lists for database kind, data source, and root object as well as text fields containing the folder and project names. The Description section shows a text field for entering a description. Please note that the properties for database kind and root object are filled in automatically when you select a data source from the drop-down list. However, you can then change the root object, if applicable.

Design and Favorites properties

For the Design and Favorites folders, the Properties window provides drop-down lists for database kind, data source, and root object. In addition, a text field for entering a description is available. The Design properties include also a text field displaying the project name.

Data Diff properties

In the Data Diff folder, DatabaseSpy displays statistical information on the comparison file, and you have the possibility to edit the [compare options](#) as well as the options for string and xml comparison and the merge execution options on file level.

Schema Diff properties

In the Schema Diff folder, DatabaseSpy displays statistical information on the comparison file, and you have the possibility to automatically start a comparison when the document is opened.

6.7.2 SQL Properties

The following properties of SQL files as well as SQL Editor windows (with or without SQL statements) are displayed in the Properties window:

Overview

File Kind	Always reads "SQL" for SQL files.

Options	
SQL Editor should require semicolons	Activate this check box to improve performance and reliability of all parser-dependent operations. Only statement that are terminated with a semicolon will be considered by the parser.
Group statements for execution with:	Here you can choose how statements should be grouped when the script in the SQL Editor window is executed.
General	
Database Kind	For unsaved SQL Editor windows, this drop-down list lets you define a database type. Note that this field will be adapted automatically if you choose a data source.
Data Source	Here you can choose from the data sources that have been added to the project. As several data sources may be active at one time, it is necessary to be able to assign data sources to SQL files as a group or individually. Please note: Assignments made in the project tab apply to the SQL files when they are opened or executed.
Root Object	If a data source has already been selected, you can choose a root object from this drop-down list.
Description	
Description	Here you can enter a description of the file.
File	
Creation Date Modification Date Access Date	Displays the respective creation and modification dates and shows when the file has last been accessed.
Size	Shows the file size.
Read Only Hidden	These properties are read-only and can only be changed outside DatabaseSpy.
Full Path	Displays the full path to the file. To jump directly to this location, right-click the file in the Project window and select Locate File... from the context menu.

Default properties for SQL Editor windows

The following scenarios can occur when you open a new SQL Editor window:

- **No project:** If no project has been opened in the Project window, any new SQL Editor window that you open will have the properties Database Kind = "Unknown" and Data Source = "Offline".
- **Data source connected:** If you open an SQL Editor window immediately after you have connected to a data source, the connection properties of this data source will be used for that SQL Editor window. Note that the data source still has to be selected in the Project window.
- **Several data sources defined in one project:** If you have opened a project with several different data sources, you can set the connection properties by clicking on a particular data source before opening an SQL Editor window. If you select a disconnected data source, the Execution Target Bar provides you with a **Connect** button to establish a connection to the data source. Clicking on any other item in the Project window will open an SQL Editor in the Offline mode.

Working with SQL files in the Offline mode

One of the options available to you when selecting from the `Data Source` combo box is

"Offline". Designating an SQL file as offline means that it is blocked from being executed. The file cannot be executed when opened in the SQL Editor or when selecting **Execute SQL** from the context menu in the Project window.

All SQL Editor commands and functions are available when editing this file however, you just have the added security of not being able to execute it without having to change the settings in the Properties window.

To define individual settings for project SQL files:

1. In the Project window, select an SQL file in the SQL folder.
2. In the Properties window, select the data source that you want to assign to the file from the `Data Source` field. Active data sources are highlighted in the Properties window as well as in the `Data Source` drop-down list.
3. If required (e.g., because the SQL file includes target keywords), choose either "Semicolons" or "SQL Grammar" from the `Group statements for execution with` drop-down list.
4. If you want the parser to consider only statements that are delimited by semicolons, activate the `SQL Editor should require semicolons` check box and select the desired option from the `Group statements for execution with` drop-down list.

If you have [defined properties for the different folders](#) in the Project window, any file that you add to your project will inherit these properties from its parent folder. You can change the properties for a file at any time. DatabaseSpy displays properties that deviate from the parent folder's values in bold type. Once you have changed a property of a file, the link between the file's property and its parent folder's property is broken and will also not be restored by choosing the identical value in the file's drop-down list. You can, however, [restore the folder-file connection](#) by using the respective command in the context menu.

To define individual settings of a file opened in the SQL Editor:

1. In the SQL Editor, click the tab of the SQL file whose properties you want to define or change.
The file settings are displayed in the Properties window.
2. Change the settings according to your needs by double-clicking the `Data Source` or `Root Object` field in the Properties window and choosing an option from the drop-down list.
3. If required (e.g., because the SQL file includes target keywords) choose either "Semicolons" or "SQL Grammar" from the `Group statements for execution with` drop-down list.
4. If you want the parser to consider only statements that are delimited by semicolons, activate the `SQL Editor should require semicolons` check box and choose the appropriate option from the `Group statements for execution with` drop-down list.
5. Save the SQL file.

6.7.3 Design Properties

In addition to the Properties window, you can show the properties of a column, an index, a key, or a check constraint directly in a Design Editor window. Design Editor's table display shows the data type and the `Nullable` check box for columns, the column and order for indexes, the column and referenced key for keys, and the expression for check constraints.

When you select an index, key, or check constraint in the table display in the Design Editor, the

referenced column is automatically printed in bold.

When you click into an empty area of a Design Editor window, the design properties are displayed in the Properties window. Here you can change the data source or schema and view the file properties and path of the design file.

	Overview
File Kind	Always reads "Design" for design files (*.qdes).
	General
Database Kind	For unsaved SQL Editor windows, this drop-down list lets you define a database type. Note that this field will be adapted automatically if you choose a data source.
Data Source	Here you can choose from the data sources that have been added to the project. As several data sources may be active at one time, it is necessary to be able to assign data sources to SQL files as a group or individually. Please note: Assignments made in the project tab apply to the SQL files when they are opened or executed.
Root Object	If a data source has already been selected, you can choose a root object from this drop-down list.
	Description
Description	Here you can enter a description of the file.
	File
Creation Date	Displays the respective creation and modification dates and shows when the file has last been accessed.
Modification Date	
Access Date	
Size	Shows the file size.
Read Only	These properties are read-only and can only be changed outside DatabaseSpy.
Hidden	
Full Path	Displays the full path to the file. To jump directly to this location, right-click the file in the Project window and select Locate File... from the context menu.

Please note: The connection properties can only be changed for new designs. As soon as you

show a table in a Design Editor window, the connection properties cannot be changed anymore.

To view the properties of a design file:

Do one of the following:

- Click into an empty area of a Design Editor window.
- If the design file has already been added to the project, click the QDES File in the Design folder of the Project window.

The properties of the design are displayed in the Properties window.

6.7.4 Comparison Properties

When you click into an empty area of a **Data Comparison** or **Schema Comparison** window, the comparison properties are displayed in the Properties window. Here you can change the way tables and columns are compared, how the comparison file is stored in the project, and define several options for string and XML comparison. Properties that apply only to data comparisons are printed in *italics* type.

File Kind	Overview Reads "Data Comparison" for database data comparison files (*.dbdif) and "Structure Comparison" for database schema comparison files (*.dbsdif).
Compare:	Compare Options <i>Changes between native comparison and string comparison. Note that XML comparison is only supported in native comparison mode.</i>
Keep only different rows in memory	<i>Stores only rows that contain differences in the database data comparison file.</i>
Use native comparison for XML columns	<i>The content of XML columns will be compared as native XML. If this option is activated, additional properties are available in the XML Compare Options section.</i>
Append trailing zeros to float-numbers	<i>Floating point numbers will be filled up with trailing zeros.</i>
Ignore case	<i>Different case of database data will be ignored during comparison.</i>
Ignore whitespaces	<i>Whitespace will not be considered for the comparison.</i>
Start comparison when opening a document	<i>A comparison will be started automatically if a comparison document is opened in DatabaseSpy.</i>
Processing mode:	<i>Choose between sequential and parallel processing.</i>
Treat [NULL] as empty string	String Options <i>NULL-values will be regarded as empty string for comparison.</i>
Use transactions for merge	Merge Execution Options <i>Transactions will be used when changes are committed to the database as a result of a merge.</i>
Rollback on errors	<i>If an error occurs during the merge, the files will be rolled back to their original content.</i>
Compare whitespaces:	XML Compare Options <i>Choose whether whitespace should remain unchanged, be normalized (i.e., all consecutive whitespace characters are reduced to one whitespace character), or be stripped (i.e., not considered) for comparison.</i>
Ignore case	<i>Different case will be ignored during comparison.</i>

<i>Don't ignore case in node names</i>	<i>Different case of node names will be regarded as difference.</i>
<i>Ignore namespace</i>	<i>Skips the namespace when comparing.</i>
<i>Ignore prefix</i>	<i>Ignores prefixes when comparing.</i>
<i>Ignore order of children</i>	<i>Compares nodes without considering the order in which child nodes appear.</i>
<i>Ignore order of attributes</i>	<i>Does not consider the order in which attributes appear.</i>
<i>Resolve entities</i>	<i>When activated, resolves all entities in the document, or compares entities as is when not activated.</i>
<i>Ignore text</i>	<i>Differences in corresponding text nodes will not be reported.</i>
<i>Ignore node depth</i>	<i>The additional depth of any element (i.e., more levels of descendants) relative to the depth of the corresponding element in the compared file will be ignored. This option must be unselected to enable merging and exporting differences.</i>
<i>Ignore Attributes</i>	<i>Nodes of type attribute will be ignored.</i>
<i>Ignore CDATA</i>	<i>Nodes of type CDATA will be ignored.</i>
<i>Ignore Comments</i>	<i>Nodes of type Comments will be ignored.</i>
<i>Ignore Processing Instructions</i>	<i>Nodes of type Processing Instruction will be ignored.</i>
<i>Ignore Doctype</i>	<i>Nodes of type DOCTYPE will be ignored.</i>
<i>Ignore XML declarations</i>	<i>Nodes of type XML Declaration will be ignored.</i>

Description

Description Here you can enter a description of the file.

File

Creation Date Displays the respective creation and modification dates and shows when the file has last been accessed.

Modification Date

Access Date

Size Shows the file size.

Read Only These properties are read-only and can only be changed outside DatabaseSpy.

Hidden

Full Path Displays the full path to the file. To jump directly to this location, right-click the file in the Project window and select **Locate File...** from the context menu.

Chapter 7

Browsing Data Sources

7 Browsing Data Sources

When you connect to a data source in DatabaseSpy, the data source is also displayed in the **Online Browser**, a powerful tool for analyzing, browsing, and searching for database objects, and for viewing the database structure of multiple databases simultaneously.

The Online Browser gives you an overview of the database objects on the database server(s) to which you are currently connected. Furthermore, you can [show the row count](#) for tables and views, [generate SQL statements](#) or retrieve data directly from the Online Browser and show them in the [SQL Editor](#), or [view the design](#) of a database object in the [Design Editor](#).

In the current version of DatabaseSpy, the following database objects are supported and displayed in the Online Browser:

- Databases
- Schemas
- Tables
- Views
- Procedures
- Columns
- Constraints
- Keys
- Indexes
- DataTypes
- XML Schemas (for DB2, SQL Server, and Oracle databases)
- Functions
- Triggers

Layouts

Different [layouts](#) for the objects in the Online Browser can be selected and you can [apply filters](#) to different folders as well as use the [Object Locator](#) to locate specific database objects in the Online Browser. Furthermore, you can also define [favorites](#) to facilitate quick access to objects that you use frequently.

Connection method

A check box is available in the [Online Browser options](#) that, when activated, shows also the connection method in the Project window as well as in the Online Browser together with the data source connection name.

Data comparison

When selecting tables and/or columns for comparison by clicking the **Browse** button in a Data Comparison window, DatabaseSpy displays the **Select Database Objects for Comparison** dialog box, which basically includes a variation of the Online Browser.

After you have clicked **OK**, DatabaseSpy displays the data source and its selected tables in a Data Comparison window. Each of the two databases is displayed in a component containing a tree structure of the tables that have been selected for comparison. The tables can be collapsed or expanded to show or hide the table columns.

Display options in the Data Comparison window

In the Data Comparison window, the schema of compared tables is displayed by default. In the [Data Compare options](#), you can disable this option, and you can also choose to display the tables' data source name in the header of each component.

7.1 Expanding and Collapsing Elements

In the Online Browser, you can expand and collapse either individual elements or use the menu commands to expand or collapse all siblings or children of a certain element.

To expand or collapse a single element:

Do one of the following:

- To expand an element, click the **+** icon to the left of the element. Alternatively, you can also select the element and press the right arrow key or the **NUM +** key.
- To collapse an element, click the **-** icon to the left of the element. Alternatively, you can also select the element and press the left arrow key or the **NUM -** key.

To expand or collapse siblings or children:

- Right-click an object in the Online Browser and select one of the following from the context menu:
 - **Expand | Siblings:** Fully expands all contents of the objects that are on the same level as the selected object. For example, if you right-clicked on a table, all sibling tables and the selected table will be expanded.
 - **Expand | Children:** Fully expands the descendent objects of the selected object.
 - **Collapse | Siblings:** Collapses all contents of the objects that are on the same level as the selected object. For example, if you right-clicked on a table, all sibling tables and the selected table will be collapsed.
 - **Collapse | Children:** Collapses the descendent objects of the selected object.

7.2 Counting Data Rows

You can display the number of rows contained in a table or view directly in the Online Browser without having to retrieve the data first. The context menu provides an additional **Row Count** sub-menu for this purpose, which contains options for showing/updating and clearing the row count. The **Row Count** sub-menu is also available for the Tables and Views folders and their sub-folders, allowing you to update the row count information for all tables or views with a single click.

When you move the mouse cursor over tables or views in the Online Browser, a hyperlink appears to the right of the object name. This hyperlink reads "(count)" if no row count has been done yet (see *screenshot above*), or "(n) update" if a number of n rows has already been retrieved. Clicking this hyperlink will also update the row count information.

The row count feature can be disabled by deactivating the corresponding check box in the [Online Browser options](#).

To show the row count in the Online Browser:

1. Make sure that the `Optional display of Table and View row counts` check box is activated in the Online Browser options.
2. Do one of the following:
 - Right-click a table, view, or folder containing tables or views in the Online Browser and select **Row Count | Show/Update** from the context menu.
 - Place the mouse cursor over a table or view and click the (count) hyperlink that appears.
3. To update the row count information, repeat step 2. Note that the hyperlink reads (n) update, where n is the number of rows.

To hide the row count:

- Right-click a table, view, or folder containing tables or views in the Online Browser and select **Row Count | Clear** from the context menu.

7.3 Customizing the Browser Layout

By default, database object are displayed in the Online Browser with minimum vertical spacing, so as to show as much information as possible. You can, however, change this setting in the [Online Browser options](#).

Default vertical spacing

Increased vertical spacing

To increase vertical spacing in the Online Browser:

1. Select the menu option **Tools | Options** or press **Ctrl+Alt+O**.
2. Change to the Online Browser page and deselect the `Reduce vertical spacing` check box in the Appearance group box.
3. Click **OK**.

Layouts

DatabaseSpy provides several predefined layouts for the display of the various database objects in the Online Browser. You can currently select from among the following layouts:

- The **Folders** layout organizes database objects into folders based on object type in a hierarchical tree. This is the default setting in DatabaseSpy.
- The **No Schemas** layout is similar to the Folders layout, except that there are no schema folders; tables are therefore not categorized by schema.
- The **No Folders** layout displays database objects in a hierarchy without using folders. For a better overview, you can activate the `Show labels in browser window` check box in the Display Labels group box of the [Online Browser options](#), so that the name of each database object appears as a prefix.

- The **Flat** layout divides database objects by type in the first hierarchical level. For example, instead of columns being contained in the corresponding table, all columns are displayed in a separate Columns folder.

- The **Table Dependencies** layout categorizes tables according to their relationships with other tables. There are categories for tables with foreign keys, tables referenced by foreign keys and tables that have no relationships to other tables.

In the [Online Browser options](#), you can define a default layout that DatabaseSpy uses when the Online Browser is displayed. Furthermore, you can decide in the options, whether or not the connection method should be displayed together with the data source connection name.

To select a layout for the Online Browser:

- In the Online Browser, click the layouts  icon and select the desired layout from the drop-down list. Please note that the icon changes in accordance with the selected layout.

To define the default layout for the Online Browser:

1. Choose the menu option **Tools | Options** and select the Online Browser page of the **Options** dialog box.
2. In the `Default Layout for Browser Window` group box, select the desired layout from the drop-down list.
3. Click **OK**.

To sort tables into User and System tables:

1. In the Online Browser, right-click the Tables folder.
A context-sensitive menu appears.
 2. Select **Sort into User and System Tables**.
The tables are sorted alphabetically in the User Tables and System Tables folders.
- Please note:** You must be in the Folders, No Schemas or Flat layout in order to access this function.

7.4 Selecting the Root Object

The root objects for the currently supported databases are as follows:

MS SQL Server	database
Oracle	schema
MS Access	database
MySQL	database
IBM DB2	schema
Sybase	database
IBM iSeries	schema
PostgreSQL	database

When you are connected to a data source in the Online Browser, for some of the databases you can select the root object whose contents you want to browse. The following procedure uses MS SQL Server as an example.

To select a root object in the Online Browser:

1. Click the arrow icon  that is next to the currently selected database. A list of the root objects contained in the data source appears.

2. Select the desired root object from the list.

7.5 Displaying the Design of an Element

The Online Browser also allows you to view tables and their relationships in the graphical Design Editor. You can display one or more tables in a new Design Editor window or add one or more tables to a Design Editor window that is already open.

To show an object in a new Design Editor window:

- Right-click the object whose design you want to have displayed in the Design Editor and select **Show in new Design Editor** from the context menu.
A Design Editor window opens and the selected object appears in it.

Please note: Any number of tables can be selected in the Online Browser, use **Shift+Click** to select a contiguous group, or **Ctrl+Click** to select individual tables.

To add an object to the active Design Editor window:

- Right-click the object and select **Add to Design Editor** from the context menu.

7.6 Locating Objects

To find a specific database item by its name, you can either use DatabaseSpy's [filtering functions](#) or the [Object Locator](#) which appears as a drop-down list at the bottom of the Online Browser tab.

Showing referenced tables

The Online Browser provides an option in the context menu for constraints that allows you to show the table that is referenced by the selected foreign key. This way, you can identify the referenced table with a single mouse click. Both the foreign key and the referenced table are then selected in the Online Browser and you can display the reference in a Design Editor window, if required.

To show referenced tables in the Online Browser:

1. In the Online Browser, right-click a foreign key in the Constraints folder of a table.
2. Select **Show referenced table** from the context menu.
The foreign key as well as the table it references are selected in the Online Browser.

7.6.1 Applying Filters

In DatabaseSpy's Online Browser, it is possible to filter schemas, tables, and views by name or part of a name. Objects are filtered as you type in the name. Filtering is case-insensitive by default, however you can also use case-sensitive filters by activating the corresponding checkbox in the [General options](#).

Please note: The filter function does not work if you are using [No Folders layout](#).

To filter objects in the Online Browser:

1. Click the **Filter Folder contents**  icon in the toolbar or select a database object and press **Ctrl+Ctrl+Alt+F** to activate filtering. Filter icons appear next to all folders that appear in the currently selected layout.

- Click the filter icon that is next to the folder you want to filter. Select the desired filtering option from the popup menu that appears.

- Next to the folder, the icon for the chosen filter type appears with an empty field next to it.

- Expand the folder you are filtering to display the objects it contains.
- In the field, enter the string you want to search for. The results are adjusted as you type.

7.6.2 Using the Object Locator

You can use the Object Locator in different ways. Either use the drop-down list to select one of the objects contained herein, or type a string in the text field of the drop-down list and further filter the list of objects contained in the list. Filtering is case-insensitive by default, however you can also use case-sensitive filters by activating the corresponding check-box in the [General options](#).

The icon  next to the Object Locator drop-down list opens a menu allowing you to further define the displayed database objects.

Using this menu, you can restrict the display of objects as follows:

-  **From current Data Source:** Displays only objects from the currently selected data source.
-  **From Focused Item:** Changes the display dynamically, depending on the folder or object that is currently selected.
-  **All:** Displays all objects from all data sources that are currently connected.

To find database elements using the Object Locator:

1. If the Object Locator is not enabled, click the **Object Locator**  icon in the Online Browser or press **Ctrl+L**.
2. Optionally, change the Object Locator context by clicking the arrow icon next to the drop-down list  and select one of the options.
3. Enter the string you want to look for, e.g., "type". Clicking the drop-down arrow displays all elements that contain that string.

4. Click the desired object to have it selected in the Online Browser.

7.7 Hiding Unselected Items

For a better overview in large databases, the **Select Database Objects for Comparison** dialog box allows you to show only selected database items in the individual Source group boxes. This saves you from scrolling through the list of tables and columns and you can easily check whether all items you want to compare are properly selected.

The `Show checked objects only` check box can be activated separately for both databases to be compared. When this option is checked, all unselected items are hidden in the group box and only the items that have been selected for comparison are displayed.

Chapter 8

Designing Databases

8 Designing Databases

The DatabaseSpy [Design Editor](#) lets you [view](#) and edit the structures of all your databases through one graphical user interface where you can examine [tables](#) and [relationships](#) in an existing database to understand them more easily.

You can also edit the database or even [add entire tables](#) and [specify all their column attributes](#) from scratch. In this case, an SQL script that can subsequently create this design in your database is automatically generated in the Database Structure Change Script window ready for execution.

Designs that have been created in DatabaseSpy's Design Editor can be [saved](#) for later re-use or can be [sent to a printer](#).

The only precondition for working with the Design Editor is a data source connection to an existing database, i.e., you need at least an empty database to which you can [connect](#). Design Editor's graphical user interface allows you to [add tables](#) or [columns](#) to a database, [edit their properties](#), and delete columns or entire tables. In addition, you can also create a [primary key](#), [foreign keys](#), [unique keys](#), as well as [indexes](#) and [check constraints](#).

Any changes you make to the database structure are not implemented immediately but recorded in a change script which is displayed in the [Database Structure Change Script window](#) below the Design Editor window. You must execute the change script in order to actually change the database design.

To be able to create new designs from scratch, you must first open a new **Design Editor** window. You can start the Design Editor by clicking the **Design Editor**  icon in the Standard toolbar, or selecting the menu option **File | New | Design Editor**, or pressing **Ctrl+D**. As soon as a Design Editor window is active, also the [Design Editor](#) menu is available. Each Design Editor window furthermore provides a [toolbar of its own](#) which contains various layout functions.

To open a new Design Editor from the Standard toolbar:

- Making sure that you have a [data source connected](#), click the **Design Editor**  icon in the Standard toolbar, or select the menu option **File | New | Design Editor**, or press

Ctrl+D.

A new, empty Design Editor window opens.

Please note: You require a connection to a data source to be able to start the Design Editor. The data source to which the active design window is assigned is displayed in the bottom left area of the Design Editor window and in the [Execution Target Bar](#) (if visible). You can change the data source for the active design window in the Properties window, however only connected data sources are available in the drop-down list. Working with the Design Editor in the Offline mode is not possible.

If you have more than one data source connected in your project, a new Design Editor window will always be connected to the active data source, i.e., the data source that is selected in the Online Browser.

To change the data source assigned to a Design Editor window:

1. Click into the Design Editor window whose properties you want to change.
2. In the Properties window, select the data source and, if applicable, default schema from the respective drop-down lists.

Alternatively, if the Execution Target Bar is visible in the Design Editor, click the data source or root object in the Execution Target Bar to jump directly to the corresponding field in the Properties window.

Note that only connected data sources are available in the drop-down list.

8.1 Adding Tables

When the Design Editor is connected to a data source, you can either show the design of existing tables by dragging them into the Design Editor window or by using a context menu command to do so, or you can create an entirely new table from scratch. Design Editor's table design shows the most important properties of the table and you can add indexes, keys, and check constraints with a few mouse clicks.

To show an existing table in the Design Editor:

Do one of the following:

- Right-click the table you want to examine in the Online Browser and select **Design Editor | Show in new Design Editor** from the context menu.
- If a Design Editor window is already open, you can also right-click the table and drag it into the Design Editor window or use the context menu command **Design Editor | Add to Design Editor** to add the table to the design.

To create a new table in Design Editor:

1. Optionally, choose the menu option **File | New | Design Editor** or press **Ctrl+D** to open a new Design Editor window. Alternatively, click the **Design Editor**  icon in the Standard toolbar.
2. Click the **New Table**  icon in the Design Editor toolbar or press **Ctrl+T**. Alternatively, right-click into the Design Editor and choose **Create new Table** from the context menu.
3. DatabaseSpy displays a message informing you that a change script has been created. Optionally, activate the `Don't show this dialog again!` check box and click **OK**.
4. In the table design, double-click the title bar to edit the table name.
5. To complete the table definition, modify the [column properties](#), [add columns](#), [define a primary key](#), [add a foreign key relationship](#), or [define an index](#).
6. In the Database Structure Change Script window, click the **Execute**  button to commit the changes to the database-

8.2 Selecting Tables

Dragging on the Design Editor background creates a marquee which selects all the tables it encloses. The context menu of the Design Editor also contains several options in the **Select** sub-menu which allow you to select specific sets of tables.

To select specific sets of tables:

To select only user tables, do one of the following:

- Right-click somewhere in the Design Editor window and choose **Select | Select User Tables** from the context menu.
- Click somewhere in the Design Editor window and press **Alt+T**.
- Select the menu option **Design Editor | Select User Tables**.

To select only system tables, do one of the following:

- Right-click somewhere in the Design Editor window and choose **Select | Select System Tables** from the context menu.
- Click somewhere in the Design Editor window and press **Alt+S**.
- Select the menu option **Design Editor | Select System Tables**.

To select all tables, do one of the following:

- Right-click somewhere in the Design Editor window and choose **Select | Select All** from the context menu.
- Click somewhere in the Design Editor window and press **Ctrl+A**.
- Select the menu option **Design Editor | Select All**.

To select several individual tables:

- Click a table and hold down the **Ctrl** or **Shift** key while selecting additional tables.

8.3 Opening, Saving, and Printing Design Files

You have several possibilities to open an existing design file in a Design Editor window:

- Any file that is stored in the file system can be opened via the **File | Open | Open File...** menu (**Ctrl+O**) and will be displayed under its file name in a new Design Editor window.
You may have to [select](#) or [connect](#) to the data source to which the design is assigned or [change the data source's root object](#) prior to opening the design.
- A design file that has already been added to the project can be opened from the Project window and will be displayed under its file name in a new Design Editor window.

To open a design file assigned to a connected data source:

1. Select the menu option **File | Open | Open File...** or press **Ctrl+O** to display the standard Windows **Open** dialog box.
2. Select a design file and click **Open**.
3. The design file is opened in a new Design Editor window under its file name.

To open a design file assigned to a disconnected data source:

1. Select the menu option **File | Open | Open File...** or press **Ctrl+O** to display the standard Windows **Open** dialog box.
2. Select a design file and click **Open**.
3. If the data source connection is available in the project but not connected, a message box is displayed.

4. Optionally, activate the **Automatically connect without asking in the future** check box.
This also activates the **Automatically connect data sources** check box in the [Design Editor options](#).
5. Click **Yes** to open the design.
6. The design file is opened in a new Design Editor window under its file name.

To open a design file assigned to a missing data source:

1. Select the menu option **File | Open | Open File...** or press **Ctrl+O** to display the standard Windows **Open** dialog box.
2. Select a design file and click **Open**.
3. If the data source connection is not included in the project, a dialog box appears allowing you to choose or add a connection for the design.

4. Optionally, activate the `Show only data sources matching the database kind of the design` check box to limit the display to matching data sources.
5. Do one of the following:
 - Select a matching connected data source and click **OK**.
 - Select a matching disconnected data source and do the following:
 1. In the **Open *.qdes - Data source is not connected** dialog box click **OK**.
 2. Optionally, activate the `Automatically connect without asking in the future` check box.
This also activates the `Automatically connect data sources` check box in the [Design Editor options](#).
 3. Click **Yes**.
 - Click the **Add connection** button to [add a data source to the project](#).
6. The design file is opened in a new Design Editor window under its file name.

To open a design file assigned to a different root object:

1. Select the menu option **File | Open | Open File...** or press **Ctrl+O** to display the standard Windows **Open** dialog box.
2. Select a design file and click **Open**.
3. If applicable, [select](#) and [connect](#) to a data source.
4. In the **Open *.qdes - Root object is not active** dialog box click **Yes** to change the root object in the data source connection to the root object the design is assigned to.

5. The design file is opened in a new Design Editor window under its file name.

To open a design file from the Project window:

- In the Project window, in the Design folder do one of the following:
 - Select a design file and double-click the file name.

- Right-click the file and select **Open** from the context menu.

You may have to [select](#) or [connect](#) to the data source to which the design is assigned or [change the data source's root object](#) in order to display the design in a new Design Editor window.

Saving design files

DatabaseSpy provides several options for saving designs in the Design Editor:

- **Design file (*.qdes):** These files can only be opened in DatabaseSpy.
- **Image (*.png, *.emf):** Designs that have been saved as image can be opened with any picture viewer.

Saved design files can also be added to the project and appear then in the Design folder of the Project window.

To save a design as design file:

1. Make the Design Editor window that you want to save the active window.
2. Do one of the following:
 - Right-click the tab of the Design Editor window and choose **Save** or **Save As...** if you want to save a design file under a new name or path.
 - Press **Ctrl+S**.
 - Click the **Save**  button in the Standard toolbar.

To save a design as image:

1. If you have maximized the Design Editor window, click the **Restore**  button in the upper right corner of the Design Editor.
2. Resize the window and arrange the table(s) as desired.
The borders of the window define the white space that surrounds the image.

3. To save the image, do one of the following:
 - Click the **Save Diagram as Image**  icon in the toolbar of the Design Editor window.
 - Choose the menu option **Design Editor | Save Diagram as Image**.The standard Windows **Save As** dialog box appears.
4. Enter name and path for the image.
5. In the Save as type drop-down list, select whether you want save the file as portable network graphic (PNG) or enhanced metafile (EMF).
6. Click **Save**.

Printing Designs

Designs in the Design Editor can also be printed. You can print out an entire design or select a number of objects to print only the selection. In the [General options](#), you can define whether or not the program logo is to be printed on top of the page.

A print preview is available for you to check the layout of the printed page before sending it to the printer.

To print a design file:

1. Click in the Design Editor window to make it active.
2. Select the menu option **File | Print...**, or press **Ctrl+P**, or click the **Print** icon in the Standard toolbar.
The **Print** dialog box appears.

3. In the **What** group box, define whether to print the whole diagram or only the selected objects.
4. Choose the appropriate zoom factor in the **Zoom** group box.
The **Use optimal** option ensures that the design is printed on one page.
5. Optionally, define the printer setup by clicking the **Print Setup** button.
6. Optionally, click the **Preview** button to preview the print-out before actually sending it to the printer.
7. Click **Print**.

To preview a design file before printing:

1. Click in the Design Editor window to make it active.
2. Select the menu option **File | Print Preview**, or press **Ctrl+P**, or click the **Print** icon in the Standard toolbar.
The **Print** dialog box appears.
3. In the **Print** dialog box, click **Preview**.
4. In the print preview do one of the following:
 - Click the **Print** button to print the file.
 - Click **Close** to return to the **Print** dialog box.

Chapter 9

Retrieving and Editing Data

9 Retrieving and Editing Data

In DatabaseSpy, you can retrieve database data directly from the Online Browser or from a table design in the Design Editor using the **Retrieve data** option in the context menu. The required query is generated and executed with one single mouse click and the data is displayed in a Result tab of the SQL Browser. You can choose to retrieve all rows at once or only a particular number of rows at a time.

In databases for which [direct data editing](#) is supported, you can retrieve data for editing in the Result window. DatabaseSpy provides the **Edit Data** option in the context menu of the Online Browser for this purpose. The Result window is switched into the Editing mode in this case, indicating this condition in its status bar.

The Result window is maximized to allow for the optimal display of the retrieved data. Click the

Go to statement  button if you want to review and, if required, edit the statement that was used to retrieve the data.

You can also select individual columns of a table when using the **Retrieve data** and **Edit data** commands. Only data from these columns will be retrieved in this case. Note however that nevertheless all columns may be retrieved if you have deactivated the *Generate SELECT statements with full column list* check box in the [SQL Generation](#) options.

To retrieve data:

- In the Online Browser, right-click the object(s) you want to retrieve data from and select **Retrieve data | All rows (Ctrl+Alt+R)** or **Retrieve data | First n rows (Ctrl+Alt+T)** from the context menu.
- In the Design Editor, right-click either the title bar or one or several individual columns (using Ctrl+click) in a table design and select **Retrieve data | All rows (Ctrl+Alt+R)** or **Retrieve data | First n rows (Ctrl+Alt+T)** from the context menu.

An SQL Editor window opens which displays the query for the data retrieval. If you have selected objects from different tables, separate SELECT statements for the individual tables are created. The results of the query are displayed in the Result window below.

To retrieve data for editing:

- Provided that direct editing of database data is supported for the respective data source connection, right-click a table or column in the Online Browser and select **Edit Data** from the context menu.

Partial retrieval

In the [SQL Editor options](#), you can define the number n of rows to be retrieved if you select the **Retrieve data | First n rows** option from the context menu. You can then use the [toolbar icons of the Result window](#) to retrieve the data in fractions.

Stopping the retrieval

While data is being retrieved, the status bar of the Result tab counts up the rows already retrieved and displays the execution time. In addition, the tab of the respective SQL Editor window shows an icon at the left side, indicating that data is still being retrieved.

While data is being retrieved, the **Execute**  button is replaced by the **Stop Retrieval**  button in the SQL Editor toolbar. You can stop the retrieval process at any time by clicking the **Stop Retrieval** button. The status bar indicates that the retrieval has been stopped.

To stop the retrieval of database data:

- Click the **Stop Retrieval**  button which is visible in the SQL Editor toolbar while data is being retrieved.

To resume the interrupted retrieval of database data:

Do one of the following:

- To retrieve the next n rows of data, click the **Retrieve next n rows**  icon or right-click anywhere in the Result tab and select **Retrieve next n rows** from the context menu.
- To retrieve all outstanding data, click the **Retrieve outstanding rows**  icon or right-click anywhere in the Result tab and select **Retrieve outstanding rows** from the context menu.

Editing database data in the Result window

To be able to edit the data contained in your database tables, DatabaseSpy provides two different approaches: You can either [generate the corresponding SQL statements](#) and execute them in the SQL Editor or, more conveniently, retrieve data and edit it directly in the Result window.

The Result window has to be enabled for editing before you can make any changes to the data displayed in the result grid. For this purpose, the context menu of the Online Browser as well as the context menu that opens when you right-click into a table design in the Design Editor provides the **Edit Data** command which is available on table and column level. This command generates a SELECT statement which appears in a new SQL Editor window and is executed immediately, thus switching the Result window into the Editing mode.

In addition, also the **Execute for Data Editing**  button is available in the SQL Editor toolbar, allowing you to execute a SELECT statement and, at the same time, switch the Result window into the Editing mode. This is particularly useful if you have already retrieved data and now want

to update some of the records. The table below shows the editing options for the individual data source connections.

To select data for editing in the Result window:

Do one of the following:

- In the Online Browser or in a Design Editor window, right-click the table or column you want to edit, and choose **Edit Data** from the context menu.
A SELECT statement is created and executed automatically in the SQL Editor.
- [Generate a SELECT statement](#) in a new SQL Editor window and click the **Execute for Data Editing**  button, if available for the currently used data source connection.

Please note: Not all editing options (update, insert, or delete row) may be available, depending on the data source connection you are currently using, and on whether the table you are editing has or has not a primary key defined. For details, please see the table below.

	Update		Insert		Delete		XML Editing	
	ODBC	ADO	ODBC	ADO	ODBC	ADO	ODBC	ADO
IBM DB2 9	■		■	 or 	■			
IBM DB2 8.x	■		■	■	■		n/a	n/a
MS Access			■				n/a	n/a
MS SQL Server 2008			■	■	■	■		
MS SQL Server 2005	■	■	■	■	■	■		
MS SQL Server 2000		■	■	■		■	n/a	n/a
MySQL 5.x			■	■			n/a	n/a
MySQL 4.x				 or 			n/a	n/a
Oracle 9i				■			*)	*)
Oracle 10g				■		■	*)	*)
Oracle 11g		■	■	■	■	■	*)	*)
Sybase 12							n/a	n/a
IBM iSeries v5			■	■			n/a	n/a
PostgreSQL								n/a

- supported for data editing (right-click and choose **Edit data**) as well as for execution with editing (click the **Execute for Data Editing** button in the SQL Editor toolbar)
-  supported only for data editing
-  supported for data editing as well as for execution with editing only on tables that have a primary key defined
-  supported for data editing only on tables that have a primary key defined
- *) depends on the driver that is used

Please note the following restrictions that apply when editing of data in the Result window is concerned:

- Only SELECT statements may be present in the SQL Editor window if the **Execute for Data Editing** command is used. If you click the **Execute for Data Editing** button while any other statement is in the SQL Editor, the statement will be executed without switching the Result window into the Editing mode.
- Tables that do not have a primary key defined are only partly supported for editing (see *table above*). DatabaseSpy displays a message box if you select the **Edit Data** command for such a table.

The **Show Details >>** button allows you to display the reason why the editing command has failed. If you do not want to have this dialog box displayed, you can activate the **Don't show this dialog again!** check box or disable this feature in the [SQL Editor options](#). Upon clicking **OK** in the dialog box, DatabaseSpy executes the statement and disables the editing functions in the Result window. You can then, however, [insert new rows](#) into such tables or save the content of XML fields as XML files.

- All columns that form part of the table's primary key must be included in the statement that is used for populating the result grid with records. If you omit such a column in your SELECT statement and the primary key is mandatory for a table to be edited, a dialog appears and suggests a corrected statement which you can accept or reject.

If you select **No** in the dialog box, an error message appears informing you that no new lines can be added. After you click **OK**, the statement is executed and you can edit the data in the result grid. The **Append a new row** button is disabled in the Result window.
- Columns that are the result of an equation or have certain properties such as autoincrement, timestamp, etc., are excluded from editing. A corresponding error message appears before the results are displayed. You can, however, still edit the remaining columns of the table.

9.1 Viewing Results

When an SQL Editor window includes more than one statement, the results of a query are by default displayed in separate result tabs with consecutive numbers: Result1, Result2, etc. To

change this default display mode, you can activate the **Show multiple results stacked**  button in the SQL Editor toolbar. When executing a script containing more than one query, only one result tab is displayed, and the results of the individual queries are displayed in separate panes of that tab. Note that you can change the display mode also after the query has been executed.

To display multiple queries in one result tab:

1. In the SQL Editor toolbar, activate the **Show multiple results stacked**  button.
2. Click the **Execute**  button or press **F5**.

Only one result tab has been created. It consists of two panes however, each containing the result of the individual queries.

Viewing statistical data

The status bar of the Result window can display statistical information on the cells that you have selected in the result grid. The context menu that opens if you right-click the status bar provides the following options: Count, Numerical Count, Average, Sum, Min, Max.

Each of these options can be activated individually and the corresponding statistical value, if applicable, is displayed in the status bar when cells are selected in the result grid (see *screenshot below*).

62	3	110	male	2
62	3	1500	male	4
62	3	100	male	3
52	1	500	female	11
64	2	2	female	5
41	2	3	male	2
35	2	1	female	1
35	2	1	male	2
51	4	500	female	138
51	4	623	male	147
51	4	512	female	102
Average: 323.6 Count: 11 Numerical Count: 7 Min: 1 Max: 1500 Sum: 2265				

Note that the **Count** option sums up all selected cells, whereas the **Numerical Count** omits cells that do not have a numerical data type. Naturally, the **Average**, **Min**, **Max**, and **Sum** values are based on the numerical count.

To view statistical information in the Result window:

1. In the Result window, right-click the status bar and activate the fields (i.e., Count, Numerical Count, Average, Sum, Min, Max) that you want to display in the status bar.
2. Select one or more fields in the result grid. The values for the activated statistical fields are displayed in the status bar.

Preserving results

If you want to keep a particular result, you can pin the corresponding tab in the Result window.

DatabaseSpy offers a toolbar button  as well as several options in the context menu that opens when you right-click a tab in the Result window for this purpose. When the button is toggled on, the Result tab remains visible even if different queries are executed and new Result tabs are generated. Pinned result tabs show a different icon.

Note that pinned results show a different icon in the tab. When viewing pinned results, please bear in mind that the SQL statement displayed in the SQL Editor window above the Result tab might have been changed since the query has originally been executed and that re-executing the query may display a different result.

To pin a result tab:

1. [Execute a query](#) and display its results in the Result window.
2. In the Result window, do one of the following:
 - To pin an individual result, click the **Keep result visible**  button in the toolbar of

the respective Result window or right-click the tab and select **Keep result visible** from the context menu.

- To pin all results that are currently displayed in the Result window, right-click any result tab and select **Keep all results visible** from the context menu.

Any pinned tab is kept in the Result window even if new queries are executed, and new Result tabs are generated.

To release a pinned result tab:

Do one of the following:

- To unpin a result, click the **Keep result visible** icon again, or right-click a pinned result tab and choose **Remove permanent visibility for result** from the context menu.
- To unpin all results in the Result window, right-click any result tab and select **Remove permanent visibility for all results** from the context menu.

9.2 Viewing Large Data Cells

In data cells containing a large amount of text, the Result tab displays only the first part of the text followed by an ellipsis (...). In this case, also the **Auto Size Columns** option in the context menu is limited to displaying 250 pixels. You can, however, always drag the column border to show more text.

Expanding cells temporarily

If cell content is larger than the currently visible cell width (e.g., in tables with a large number of columns), the width of a certain cell is temporarily extended if you move the mouse cursor over the data cell (see *screenshot below*). This applies also to column headings.

	Ani...	AnimalN...	Ani...	A...	Ani...	Animal...	A...	Z...
45	5044	Penny	44	2	1	female	4	7
46	5045	Auntie	31	2	105	female	10	9
47	5046	Snuffelupigus		2	134	male	11	10
48	5047	Walter	1	3	12	male	6	8
49	5048	Maggie	1	3	9	female	3	8

To expand single data cells temporarily:

- Place the mouse cursor over the cell you want to expand.

Using the Data Inspector

Where the temporary expansion of long data cells is insufficient, for example if you want to check the content of XML columns, DatabaseSpy provides the [Data Inspector](#) to display data cells containing a large amount of data.

The Data Inspector window can be displayed by clicking the **Show the Data Inspector window**  icon in the toolbar of the Result window or Database Data Comparison Result window, respectively, or by choosing the menu option **View | Data Inspector window**.

To view data using the Data Inspector:

- In the Result window or Database Data Comparison Result window, select a data cell and click the **Show the Data Inspector window**  icon in the toolbar. Optionally, select the menu option **View | Data Inspector Window**. The Data Inspector window opens and shows the content of the selected data cell.

2. Optionally, click the **Word wrap**  button to wrap the text in the Data Inspector window.
3. Optionally, click the **Pretty Print**  button to display the text in a hierarchical way.
4. Optionally, click the **Save As** button to save the content as text or XML.

9.3 Searching and Sorting

Data that has been [retrieved](#) from a database is displayed in DatabaseSpy's [Result window](#). If you are searching for a particular string in your data, you can either create an appropriate SELECT statement using a WHERE clause to retrieve only rows that include that string, or, you can make use of DatabaseSpy's search functionality directly in the Result window. This allows you to find also parts of words in various columns included in the result of a database query.

You can call the **Find** dialog box by clicking the **Find**  button in the Result window toolbar, or by pressing the standard shortcut **Ctrl+F** when the cursor is located in the Result window.

Please note that the **Find**  button is also available when the Result window is in the [Editing mode](#).

To find a string in the Result window:

1. [Retrieve data](#) from the table you want to search.
2. In the Result window, click the **Find**  button to display the **Find** dialog box. Alternatively, you can also click into the result grid and select the menu option **Edit | Find...** or press **Ctrl+F**.
3. Type the string you are looking for into the `Find what` field.
4. Optionally, activate the `Match whole word only` check box if you want to restrict your search to entire words that match the search term.
5. Optionally, activate the `Match case` check box if you want to consider the case when searching.
6. Click **Find next** to start the search. The first occurrence of the search term is highlighted in the result grid.
7. Optionally, click **Find next** again to jump to the next occurrence of search term or click **Find prev** to jump to the previous occurrence of the search term, if available.
8. To quit the search, click **Cancel**.

Sorting results

By default, the data is sorted according to its primary key column in ascending order. You can change the sort order in the result grid using the context menu, or by clicking the sorting arrows in the column headers, provided that this option has been activated in the [SQL Editor options](#).

If sorting symbols are displayed in the column headers, you can click them to toggle the sorting order in the sequence ascending – descending – default. The shape of the respective sorting

symbol changes accordingly.

	BirthID	BirthDate	Mother	Father	Veterinarian	NumberInLitter
1	1	2005-01-16	5056	5055	4	3
2	7	2005-09-14	5051	5050	1	1
3	3	2005-11-07	5053	5054	6	4

In the example illustrated in the screenshot above, data is sorted in ascending order according to the `BirthDate` column.

To sort data in the result grid:

Do one of the following:

- Right-click anywhere in the column to be sorted and select either **Ascending** or **Descending** from the **Sorting** sub-menu of the context menu.
- Click the sorting symbol in any of the column headers to sort the data. The data is sorted according to the contents of that column in ascending order. Click the same column again to sort in descending order. A third click restores the default sort order.

To restore the default sort order:

- Right-click anywhere in the table and choose **Sorting | Restore default** from the context menu.

9.4 Printing Results

Data cells that you select in the result grid can be printed via the menu command **File | Print Preview**. This opens the selected cells in a separate pane, where you can zoom into or out of the grid and send the data to the printer. Alternatively, you can also use the **File | Print...** command, which opens the **Print** dialog box with the **Selection** option preselected in the Print range group box. Note that in the latter case no preview or zooming options are available.

	Employee ID	Supervisor ID	Last Name	First Name	Position	Birth Date
1	1	5	Davolio	Nancy	Sales Representative	1972-12-08
2	2	{NULL}	Fuller	Andrew	Vice President, Sales	1969-02-19
3	3	5	Leverling	Janet	Sales Representative	1971-08-30
4	4	5	Peacock	Margaret	Sales Representative	1973-09-19
5	5	2	Buchanan	Steven	Sales Manager	1975-03-04
6	6	5	Suyama	Michael	Sales Representative	1963-07-02
7	7	5	King	Robert	Sales Representative	1972-05-29
8	8	5	Callahan	Laura	Inside Sales Coordinator	1974-01-09
9	9	5	Dodsworth	Anne	Sales Representative	1976-01-27
10	10	2	Hellstern	Albert	Business Manager	1968-03-13
11	11	10	Smith	Tim	Mail Clerk	1973-06-06
12	12	10	Patterson	Caroline	Receptionist	1979-09-11
13	13	2	Brid	Justin	Marketing Director	1977-10-08
14	14	13	Martin	Xavier	Marketing Associate	1975-11-30

The example above shows the result of a retrieval of an employees table. You can select particular names in this result (e.g., all the managers) and print only their names and positions (see screenshot below). Only selected rows and columns will be printed.

	Last Name	First Name	Position
1	Fuller	Andrew	Vice President, Sales
2	Buchanan	Steven	Sales Manager
3	Hellstern	Albert	Business Manager
4	Brid	Justin	Marketing Director

9.5 Updating Data

Altova web site:  [database editor](#)

To be able to update data in the Result window you must first [select data for editing](#). This switches the Result window into the Editing mode, which is indicated by the status bar.

 Editing Mode Rows: 7, Cols: 6 3,421 sec 08:48:24

The updated data is not immediately committed to the database but only displayed in the result grid. Data cells that have been edited are indicated by a different background color.

	ID	NAME	STATUS	CONTACTINFO
1	3227	Ella Kimpton	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
2	8877	Chris Bontempo	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
3	9077	Lisa Hansen	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
4	917a	Rita Gomez	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
5	5681	Paula Lipenski	Standard	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
6	4309	Tina Wang	Silver	 <?xml version="1.0" encoding="UTF-8" ?><Clie...

If XML columns are present in the Result window, an additional button for each row appears inside the XML column: .

3	9077	Lisa Hansen	Silver	 <?xml version="1.0" encoding="UTF-8" ?><C...

Clicking this button allows you to load an XML file into this XML cell or to save the XML content of the respective cell as XML file. Furthermore, you can [assign an XML schema](#) to the XML cell, provided that the current data source connection supports this feature. In databases where XML columns are currently not supported by DatabaseSpy, this icon changes to  and you can only save the XML content of the respective cell to a file.

13	14	dog kibble	350	8	400	 <Client xmlns:xsi="http://www.w3.org/2001 ...

In the Editing mode, the toolbar also shows four additional options: the **Append a new row** , **Delete row** , and **Undo all changes**  icons as well as the **Commit**  button.

To actually commit the update to the database, the Result window provides a **Commit**  button in its toolbar. DatabaseSpy automatically creates the required SQL statements and executes them. If the execution fails, you can view the statements in the Output window and check why they have not been executed successfully. In our example above, the invalid ID update in the `STATUS` column would result in an error message (see *screenshot below*). The commit fails and the records are still displayed as edited. You have to consult the error message in the Message tab and correct the invalid entry.

In such a case, the edited cell remains marked modified in the Result window, however if you choose to retrieve data once again, the (incorrect) update will be lost if you confirm the corresponding warning that pops up in a message box.

To edit record sets in the Result grid:

1. In the Result window, double-click the cell you want to edit and proceed like in any spreadsheet application. You can use the context menu to copy, cut, paste, delete, or select all content or to undo your editing action.
2. Optionally, [add a new set of records](#) to the result grid.
3. To commit your changes to the database, click the  button in the Result window toolbar.

To assign predefined values to a cell:

1. Right-click a data cell and select one of the following:
 - To assign the NULL value to the data cell, select **Set Null** from the context menu.
 - To change the record to the predefined default value, select **Set Default** from the context menu.
2. Click the  button in the Result window toolbar.

To undo the editing of a particular cell:

- Right-click a data cell that has been edited and select **Undo Changes for this Cell** from the context menu.

To reject all changes that have been made to a record set:

- Provided that the changes have not been committed to the database yet, click the **Undo all changes**  button.

Using SQL

If you need to update existing data in your database, DatabaseSpy can generate the required SQL statement with a click of the mouse. You can either update an entire row or only particular columns of a table. The corresponding SQL statement appears in an SQL Editor window where you can enter the new values.

```
1  UPDATE [Department] SET [id]=, [name]=' ' ;
2
```

Take a look at the `Department` table in your Access tutorial database.

	id	name
1	0	Science
2	1	Math
3	2	Art

Let's assume you want to change the "Art" department to "Music" and the ID from "2" to "3", you would have to edit the SQL statement as follows:

```
1      UPDATE [Department] SET [id]=3, [name]='Music'
      WHERE [id]=2 ;
```

To update a table:

1. Connect to the database and show the respective data source in the Online Browser.
2. Optionally, right-click the table you want to update and choose **Retrieve data | All rows** to see the data that is contained in the table.
3. Do one of the following:
 - Select the respective table you want to update.
 - Expand the respective table to see its columns and select the column(s) you want to update.
4. Right-click and select **Show in new SQL Editor | Update** from the context menu or, holding down the right mouse button, drag the selected objects into an open SQL Editor window and choose **Update** from the popup.
An UPDATE statement for all the selected objects is generated in the SQL Editor.
5. Enter the new values after the equals sign of the respective column.
6. Add a WHERE statement to select only a particular row.
Note that **all** rows of the table will be updated with the same values if the WHERE statement is omitted.
7. Click the **Execute**  button to execute the statement and to update the data in the database.

9.6 Editing XML Columns

Columns of type XML in DB2 9, SQL Server 2005, and SQL Server 2008 databases cannot be edited directly, however you can use the context menu to change the XML instance of an individual data cell. Clicking the Browse  button that is located inside the XML column shows a popup menu allowing you to save the XML instance or load a different XML instance from the file system. It is also possible to [assign an XML schema](#) to the selected data cell.

ID	NAME	STATUS	CONTACTINFO
1 3227	Ella Kimpton	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
2 8877	Chris Bontempo	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
3 9077	Lisa Hansen	Silver	 ?><Clie...
4 9177	Rita Gomez	Silver	 ?><Clie...
5 5681	Paula Lipenski	Standard	 ?><Clie...
6 4309	Tina Wang	Silver	 <?xml version="1.0" encoding="UTF-8" ?><Clie...

The XML instances stored in an XML data cell in the database can be changed by selecting an XML file from the file system. DatabaseSpy presents the standard Windows **Open** dialog box for this purpose.

To change the XML instance of a database data cell:

1. Click the Browse  button inside the data cell you want to edit.
2. From the menu that appears, select **Load XML Document from File...** or **Save XML Document to File...**
3. Do one of the following:
 - In the **Open** dialog box, browse to the desired XML instance and click **Open**.
 - In the **Save As** dialog box, select the folder where you want to save the XML file, enter a name for the file, and click **Save**.
4. To commit your changes to the database, click the  button in the Result window toolbar.

9.7 Editing Binary Columns

Binary content can be stored in databases using the following data types:

Oracle	BLOB, LONG RAW, RAW, BFILE
MS SQL Server	binary, varbinary, image
MS Access	BINARY, IMAGE
MySQL	binary, tinyblob, varbinary, blob, mediumblob, longblob
IBM DB2	BLOB
IBM DB2 for i	BLOB, BINARY LARGE OBJECT, BINARY, VARBINARY
Sybase	binary, varbinary, image
PostgreSQL	byte array

In DatabaseSpy you can choose to (i) save binary content from the result grid to a file, or (ii) load binary content from a file and store it in the database. The respective menu entries are available when you click the  button inside a data cell of the result grid.

	id	name	photo	status
1	3227	Ella Kimpton	 0xFFD8FFE00010...	Gold
2	8877	Chris Bontempo	 [NULL]	Gold
3	9077	Lisa Hansen	 0xFFD8FFE00010...	Silver
4	9177	Rita Gomez	 Load Binary from File... Save Binary to File...	
5	5681	Paula Lipneski	 [NULL]	Gold
6	4309	Tina Wang	 [NULL]	Silver

DatabaseSpy presents the standard Windows **Open**, respectively the **Save As**, dialog box for this purpose. Binary content can be saved to the following formats BIN, BMP, JPG, PNG, MP3, AVI, and PDF.

To change the binary content of a database data cell:

1. Click the Browse  button inside the data cell you want to edit.
2. From the menu that appears, select **Load Binary from File...** or **Save Binary to File...**
3. Do one of the following:
 - In the **Open** dialog box, browse to the desired binary file and click **Open**.
 - In the **Save As** dialog box, select the folder where you want to save the binary file, enter a name for the file, and click **Save**.
4. To commit your changes to the database, click the  button in the Result window toolbar.

Please note: MS Access does not support the loading of a binary file in a binary column.

Please note: In PostgreSQL, you have to activate the `bytea as LO` check box on the second page of the advanced data source options of the PostgreSQL driver settings to be able to store binary data.

9.8 Inserting Data

In DatabaseSpy, you have several possibilities to populate your tables with data: You can [import database data](#) from CSV files, or [generate SQL statements in the Online Browser](#) and fill in the desired values, or you can [select data for editing](#) and [add new rows of data in the Result window](#).

Importing data

This option is recommended when you need to write a large amount of data into the database. The data can be conveniently prepared in a spreadsheet application and is then [imported](#) via the **Import data to the database** dialog box.

Generating SQL

When you want to add only several rows of data or when small tables with only a few columns are concerned, you can also generate an SQL script in the SQL Editor and enter the values manually. You can enter data for a particular column or for the entire row of a table.

To insert data into a table:

1. Connect to the database and show the respective data source in the Online Browser.
2. Right-click the table and select **Show in new SQL Editor | Insert** from the context menu or, holding down the right mouse button, drag the table into an open SQL Editor window and choose **Insert** from the popup.
An INSERT INTO statement is generated in the SQL Editor.
3. Enter the desired values in the `VALUES ( , , , , )` part of the statement (the number of commas depends on the number of columns in the respective table).
If required, check the data type of the individual columns in the Properties window of the Online Browser.
4. Click the **Execute**  button to execute the statement and to insert the data into the database.
5. Optionally, [save the SQL statement](#) if you need to insert the same kind of data frequently.

To insert data only into specific columns of a table:

1. Connect to the database and show the respective data source in the Online Browser.
2. In the Online Browser, expand the table you want to edit to and select the column(s) into which you want to insert data.
3. Right-click and select **Show in new SQL Editor | Insert** from the context menu or, holding down the right mouse button, drag the column(s) into an open SQL Editor window and choose **Insert** from the popup.
An INSERT INTO statement is generated in the SQL Editor.
4. Enter the desired value(s) in the `VALUES ( )` part of the statement.
You may also have to enter the primary key for the new table row. Add the name and the value of the primary key to the statement in this case.
Please note: If your table contains columns that have the `Nullable` check box deactivated, you must also enter values for these columns.
5. Click the **Execute**  button to execute the statement and to insert the data into the database.
6. Optionally, [save the SQL statement](#) if you need to insert the same kind of data frequently.

9.9 Adding and Copying Rows

DatabaseSpy allows you to add data in the result grid of the SQL Editor, provided that the Result window is in the [Editing mode](#). The toolbar of the Result window provides the **Append a new row** command for this purpose. This command inserts an empty row in the result grid

where you can enter data and save the record using the  button.

	ID	NAME	STATUS	CONTACTINFO
1	3227	Ella Kimpton	Gold	<?xml version="1.0" encoding="UTF-8" ?><C...
2	8877	Chris Bontempo	Gold	<?xml version="1.0" encoding="UTF-8" ?><C...
3	9077	Lisa Hansen	Silver	<?xml version="1.0" encoding="UTF-8" ?><C...
4	9177	Rita Gomez	Gold	<?xml version="1.0" encoding="UTF-8" ?><C...
5	5681	Paula Lipenski	Standard	<?xml version="1.0" encoding="UTF-8" ?><C...
6	4309	Tina Wang	Silver	<?xml version="1.0" encoding="UTF-8" ?><C...
7	[NULL]	[NULL]	[NULL]	[NULL]

You can define in the [SQL Editor options](#) that the respective default values of the individual columns be inserted into new rows. In the screenshot above, only the `STATUS` column has a default value of "Standard" defined; DatabaseSpy hence inserts "NULL" into all the other columns. If the default property has not been set accordingly, a blank row will be inserted into the result grid.

The new row remains in the result grid and is still marked new. Load an XML file into the XML data cell or use the **Set Null** option from the context menu to assign the "NULL" value.

Adding new records to incomplete selections of data

When not the entire table but a collection of individual columns is selected for data editing, the following restrictions apply when a new row is to be inserted into the result grid:

- The column(s) containing the table's primary key must be included to make data editing possible.
- All columns with the "Nullable" property not set must be included unless they have a default value defined.

Take our example from the screenshot above and assume that both the `NAME` and the `STATUS` columns are not nullable, but only the `STATUS` column has a default value ("Standard") defined. We could further assume that each new customer is automatically assigned status "Standard" and thus omit the `STATUS` column when creating new customers. Adding new rows is possible in this case since the default value is automatically assigned when the record is committed to the database.

ID	NAME	CONTACTINFO
1 3227	Ella Kimpton	<?xml version="1.0" encoding="UTF-8" ?><Clie...
2 8877	Chris Bontempo	<?xml version="1.0" encoding="UTF-8" ?><Clie...
3 9077	Lisa Hansen	<?xml version="1.0" encoding="UTF-8" ?><Clie...
4 9177	Rita Gomez	<?xml version="1.0" encoding="UTF-8" ?><Clie...
5 5681	Paula Lipenski	<?xml version="1.0" encoding="UTF-8" ?><Clie...
6 4309	Tina Wang	<?xml version="1.0" encoding="UTF-8" ?><Clie...
7 8015	John Doe	<?xml version="1.0" encoding="UTF-8"?>□□<...

When checking the results of the entire table, you will see that the default value "Standard" has been automatically inserted into the `Status` column of the new record.

ID	NAME	STATUS	CONTACTINFO
1 3227	Ella Kimpton	Gold	<?xml version="1.0" encoding="UTF-8" ?><Clie...
2 8877	Chris Bontempo	Gold	<?xml version="1.0" encoding="UTF-8" ?><Clie...
3 9077	Lisa Hansen	Silver	<?xml version="1.0" encoding="UTF-8" ?><Clie...
4 9177	Rita Gomez	Silver	<?xml version="1.0" encoding="UTF-8" ?><Clie...
5 5681	Paula Lipenski	Standard	<?xml version="1.0" encoding="UTF-8" ?><Clie...

7 8015	John Doe	Standard	<?xml version="1.0" encoding="UTF-8" ?><Clie...

However, if you omit, for instance, the `Name` column, an error message is displayed when you select the **Edit Data** command.

If you do not want to have this dialog box displayed, you can activate the *Don't show this dialog again!* check box or disable this feature in the [SQL Editor options](#). After clicking **OK**, you can still edit data in the Result window but the **Append a new row**  button and context menu option are disabled (see screenshot below).

			
ID	NAME	STATUS	CONTACTINFO
1 3227	Ella Kimpton	Gold	<?xml version="1.0" encoding="UTF-8" ?><C...
2 8877	Chris Bontempo	Gold	<?xml version="1.0" encoding="UTF-8" ?><C...

To add data to a record set:

1. In the toolbar of the Results window, click the **Append a new row**  button.
Alternatively, you can also right-click into the grid and select **Append new row** from the context menu or use the keyboard shortcut **Alt+Insert**.
A new row is inserted into the result grid.
2. Enter the required data.
3. Click the  button to commit the changes to the database.
DatabaseSpy creates and executes the SQL statements required to update the table in the database in the background.

Copying rows

If you need to duplicate some of the data stored in your database tables, DatabaseSpy provides a feature allowing you to copy data from the result grid and append that content to the grid in a new row. You can either copy an entire row or individual cells. If you copy data from more than one row and append it as new rows, DatabaseSpy will create as many new rows as there were to host the original data.

To copy a row and append it to the result grid:

1. Make sure that the Result window is in the [Editing mode](#).
2. In the Result window, right-click into the row you want to copy and choose **Selection | Row** from the context menu.
Alternatively, click several individual data cells using **Ctrl+Click**.
3. Right-click anywhere into the Result window and choose **Copy selected cells** from the context menu or click **Ctrl+C**.
4. Right-click anywhere into the Result window and choose **Paste as new rows** from the context menu or click **Ctrl+Shift+V**.

Copying records and using data outside DatabaseSpy

You can use the clipboard to export selected records to any other application that supports the clipboard. It might be helpful to include also the headers of the selected data, even if only a fraction of a record set is copied. The context menu in the Result tab provides the **Copy selected cells with header** command for this purpose. The corresponding header will be copied to the clipboard together with each selected cell.

9.10 Deleting Data

To delete a row from a table, DatabaseSpy provides an option in the context menu of the Online Browser. Selecting this option generates a DELETE statement in a new or existing SQL Editor window. Be sure to edit this statement in order to delete the row(s) that are obsolete since executing the statement as is will not delete any rows from the selected table (the default statement selects rows where the primary key is NULL)!

To delete data from a table:

1. Connect to the database and show the respective data source in the Online Browser.
2. Optionally, right-click the table you want to update and choose **Retrieve data | All rows** to see the data that is contained in the table.
3. In the Online Browser, right-click the respective table and select **Show in new SQL Editor | Delete data** from the context menu or, holding down the right mouse button, drag the table into an open SQL Editor window and choose **Delete data** from the popup.
A DELETE statement for the selected table is generated in the SQL Editor and a default WHERE statement is added.
4. Edit the WHERE statement accordingly to select only a particular row for deletion.
Please note: All rows of the table will be deleted if the WHERE statement is omitted.
5. Click the **Execute**  button to execute the statement and to delete the data from the database.

Deleting data in the Result window

You have two options to delete records in the Result window: Either set a particular database field to NULL or delete an entire row. Both options are provided in the context menu that is available when the Result window is in the Editing mode. The affected fields or rows are marked modified until the changes are committed to the database. This enables you to also undo the editing if the need should arise.

	ID	NAME	STATUS	CONTACTINFO
1	3227	Ella Kimpton	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
2	8877	Chris Bontempo	Gold	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
3	9077	Lisa Hansen	Gold	 NULL
4	9177	Rita Gomez	Silver	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
5	5681	Paula Lipenski	Standard	 <?xml version="1.0" encoding="UTF-8" ?><Clie...
6	4309	Tina Wang	Silver	 <?xml version="1.0" encoding="UTF-8" ?><Clie...

In the screenshot above, the CONTACTINFO field has been set to "NULL" for the third record, and the entire fifth record has been deleted. Note that the changes have not yet been committed to the database and can still be undone.

To set a database field to NULL:

1. Right-click the database field you want to change and select **Set Null** from the context menu.
2. Click the  button.

To delete a row of records in the result grid:

1. Right-click one of the fields in the row you want to delete and select **Delete Row** from the context menu or click anywhere into the row and click the **Delete row**  button. The row is marked for deletion (see *screenshot above*).
2. Click the  button.

To restore deleted rows in the database:

- Provided that the modified fields in the result grid have not been committed to the database yet, right-click into the deleted row and select **Undo changes for this Cell** from the context menu.
The entire row of records is restored in the result grid.

Chapter 10

Displaying Charts

10 Displaying Charts

After you have retrieved data and displayed the record set in a result window, you can open a chart that depicts the selected data. Several types of charts, such as pie chart, bar chart, line chart, area chart, or gauge chart, are available and the appearance of the chart can be [customized](#). Charts are displayed in the Charts window at the bottom of the application, this is where you can also change the chart type and appearance, [define what data is to be displayed](#) and how, or export the chart to file, clipboard, or printer.

The easiest way to display a chart window in DatabaseSpy is to retrieve data and then click the **Show Data in Chart Window**  button in the Result window toolbar. This opens the **Select columns** dialog box which lists all the columns that have been retrieved into the Result window. You can deactivate unwanted columns and change the sequence of the selected columns by dragging them to the desired position in the dialog box.

Unchecked columns can later be activated again when you [choose the chart data](#) in the **Chart Data** dialog box.

If you have [retrieved all columns](#) of a table but want to display only specific columns in a chart, you can select one or several columns in the Result window before you click the **Show Data in Chart Window**  button. Then only the selected columns will appear in the **Select columns** dialog box and only these columns can be used for the chart.

You can choose the X-axis for the chart from the `First Column ( Category/X-Axis )` drop-down list or leave the default setting "Auto Enumerated (not coming from source data)". In the latter case, all available columns are depicted on the Y-axis and an auto-generated value is used for the X-axis.

10.1 Defining the Chart Type

The type of a chart is defined in the **Change Type** dialog box which opens when you click the **Change Type** button in the toolbar of the Chart window. This resizable dialog box offers six different chart types (Pie, Bar, Value, Area, Candlestick and Gauge) as well as several sub-types, such as 2d or 3d charts.

Pie Charts

In Pie charts you can display the values of a single column and use another column to label the values.

You can choose between 2d and 3d display and show a legend and/or labels (legend is off, and labels are on in the above screenshot).

Bar Charts

In Bar charts, you can use non-numerical values for the X-axis.

Bar charts can be displayed in 2d or 3d.

In addition, you can also choose to display stacked bar charts if you need to show the total of the series included in the chart.

Line Charts

The difference between a normal Line Chart (*screenshot below left*) and Value Line Chart (

screenshot below right) is that in Value Line Charts you can use only numerical columns for the X-axis. If you need to display line charts with text values on the X-axis, choose "Line Chart" from the right pane of the **Change Type** dialog box.

Note that in the screenshot above at left the X-axis now has the year as a unit and not the period as previously in the bar charts.

Area Charts

Area charts are a variation of line charts where the area below the line is also colored.

If you want to display the overall sum of several data series, you can choose the stacked version of area charts (see screenshot below).

Candlestick Charts

A candlestick chart can be used to depict price movements of securities, derivatives, or currencies over a period of time. The chart provides an impression of how the asset developed, showing not only the closing price but also high and low and, optionally, the opening price per day. If you define four series (i.e., in this sequence: open, high, low, and close) the chart will look approximately like in the screenshot below.

The screenshot below shows a candlestick chart where only closing price, high and low have been defined.

Gauge Charts

Gauge charts are used to illustrate a single value and show its relation to a minimum and a maximum value. The screenshot below shows the number of participating nations in the Olympic Winter Games of 1976 in Austria in relation to the maximum of 80 participating nations in the Winter Games of 2006.

To change the type of a chart:

1. Retrieve data from a database and select the values you want to display in a chart in the result grid.
2. Click the **Show data in Chart window**  button in the Result window toolbar.
3. In the Charts window, click the **Change Type** button.
4. Select the chart type in the left pane, and the sub-type in the right pane of the dialog box and click **OK**.

10.2 Changing the Appearance of a Chart

You can change the appearance of a chart (e.g., title, legend, colors, fonts, etc.) in the **Change Appearance** dialog box, which can be called by clicking the corresponding button in the toolbar of the Chart window. Please note that this dialog box provides different options and features, depending on which chart type you have selected. For each type, [General](#), [Sizes](#), and [Fonts](#) sections are available and additional sections are provided for the individual types.

The **Change Appearance** dialog box provides a **Load/Save** button that, when clicked, displays a menu with the following options:

- **Set to default:** Rejects any changes that you have made to the settings and restores the default settings. Please note that this restores the default in all sections of the dialog box not only in the section that is currently displayed!
- **Load from file:** Shows the Windows **Open** dialog box where you can choose a file and import settings that have been previously saved.
- **Save to file:** Opens the Windows **Save As** dialog box where you can specify a file name and path where the settings should be stored. The settings are saved in an XML file which lists options that are different from the default settings.

10.2.1 General

The General section of the **Change Appearance** dialog box lets you define the title of the chart, add or remove a legend, and define background pictures and colors and—for bar, line, area, and candlestick charts—orientation of the chart.

Chart

Chart Title: Nations participating in Olympic Wintergames

Background color: Vertical Gradient

Image File: ... Stretched

☒ Draw Legend

Plot

☒ Border Border color: Red

Background color: Solid

Image File: D:\images\OlympicRings.jpg ... Stretched

Orientation

☐ Draw X and Y exchanged

Chart

Enter a descriptive title for your chart into the **Chart Title** field and select a background color for the entire chart from the drop-down list. You can choose a solid background, vertical gradient, or horizontal gradient and define start and end colors for the gradient, if applicable. In addition, or instead of a colored background, you can also define a background image and choose one of the available display options from the drop-down list:

- **Stretched:** the image will be stretched to the height and width of the chart
- **Zoom to Fit:** the image will be fit into the frame of the chart and the aspect ratio of the image will be maintained
- **Center:** the image will be displayed in its original size in the center of the chart

- **Tiled:** if the image is smaller than the chart, duplicates of the image will be displayed to fill the background area

The **Draw Legend** check box is activated by default, clear the check box if you do not want to display a legend in your chart.

Plot

The Plot is the area where the actual data of the chart is displayed. You can draw a border around the plot and specify a different background color and/or image for the plot area. In the screenshot below, the background color of the chart has been changed to gray (vertical gradient) whereas the plot is still white, a red border has been drawn around it, and a background image has been added.

Orientation

If you have a small series of large values it may be convenient to swap the X and Y axis for a better illustration. Note that in the screenshot below also the background color of the plot has been set to "Transparent" and the background image has been applied to the chart.

Note that this option is not available for pie and gauge charts.

10.2.2 Type-related Features

For each of the chart types, and even for the various sub-types, the **Change Appearance** dialog box provides a section where you can define the type-related features of the chart.

Pie chart

Most settings are the same for the 2d and 3d versions. In 2d pie charts, you can additionally draw highlights.

Start Angle: 0 °

Labels

☒ Show Labels

☐ Add Value to Labels

☐ Add Percent to Labels Decimal Digits: 0 ▾

☒ Draw Outline [Black Swatch] ▾

☒ Clockwise

☒ Draw Highlights

In 3d pie charts, you can display drop shadows, add transparency and define the 3d tilt.

Start Angle: 0 °

☒ Draw Dropshadow [Gray Swatch] ▾

Transparency: 0 ▾

3d Tilt: 40 °

Labels

☒ Show Labels

☐ Add Value to Labels

☐ Add Percent to Labels Decimal Digits: 0 ▾

☒ Draw Outline [Black Swatch] ▾

☒ Clockwise

The **Start Angle** value defines where the first row of the selected column will be displayed in the chart. An angle of 0 degrees corresponds to 12 o'clock on a watch.

You can show labels in addition to, or instead of, the legend, add values and/or percentage to the labels, and define for the percentage values the number of decimal digits to be displayed.

The color that you can select next to the **Draw Outline** check box is used for the optional border drawn around the chart and the individual pie segments. The **Clockwise** check box allows you to specify whether the rows should be listed clockwise or counter-clockwise.

In 3d pie charts, you can draw a drop shadow and define its color, add transparency to the chart, and define the 3d tilt. In 2d charts, the **Draw Highlights** option adds additional structure to the chart.

Bar chart

For bar charts, you can add an outline to the bars and define its color. In 2d bar charts, you can also draw a drop shadow and define its color (this option is not available for 3d bar charts). By default, the shape of the bars resembles a cylinder, however you can also choose "Vertical Gradient" or "Solid" from the `Fill style` drop-down list.

Line chart

To draw connection shapes that mark the values in line charts, you need to activate at least one check box in the Draw Connection Shapes group box. You can use five different shapes to mark a series: square, rhomb, triangle, inverted triangle, and circle. If there are more than five series in your chart you can combine the connection shapes by selecting more than one option in the Draw Connection Shapes group box. In the screenshot below, both `Filled` and `Slashed` have been selected and the `Slashed` type is used for the sixth series and beyond.

Connection shapes are available for both line charts and value line charts.

Area chart

Among the properties that you can change for area charts is transparency; this way you can prevent that one series is hidden by another series in the chart. In addition, you can add an outline to the individual data areas and define its color (*see screenshot below*).

Candlestick chart

Fill Color when Close > Open

☒ Unfilled

☐ ▼

Fill Color when Open > Close

☒ Use Series color

☐ ▼

If both opening and closing value are defined as series, you can choose the colors and whether or not the candle should be filled if the closing value is greater than the opening value.

Gauge chart

Start: ° Sweep: °

Value Range

Start: End:

Major Ticks

Interval: Color: ▼

Minor Ticks

Interval: Color: ▼

Colors

Dial fill: ▼ Border: ▼

Needle: ▼ Needle Base: ▼

The **Start** value defines the position of the 0 mark and the **Sweep** value is the angle that is

used for display. In the Value Range group box you can define the minimum and maximum values to be displayed. Tick marks are displayed with (major ticks) or without (minor ticks) the corresponding value; you can define separate colors for them. In the Colors group box you can define colors for the dial fill, needle, needle base (hides the first part of the needle in the center of the chart), and the border that surrounds the chart.

10.2.3 Colors

Depending on the chart type you have selected, DatabaseSpy provides two different sections for the definition of colors to be used in charts:

- Color Schema for pie, bar, line, area, and candlestick charts
- Color Range for gauge charts

Color Schema

The Color Schema section of the **Change Appearance** dialog box provides four predefined color schemas (i.e., default, grayscale, colorful, and pastel) that can be customized; in addition you can also define your own color schema from scratch.

The top color will be used for the first series, then the second color and so on. You can change the order or the colors by selecting a color and dragging it to its new positions with the mouse. To add a new or delete an unwanted color, click the corresponding button. In candlestick charts, only the first color will be used.

If you have appended one or several layers of overlay charts to a Charts window, the Color Schema section of the **Change Appearance** dialog box contains the additional radio button `Use subsequent colors from previous chart layer` which is activated by default.

When the radio button is activated, the color schema from the previous layer will be used and you cannot choose a separate color schema for the overlay. The series of the active layer will

be displayed using subsequent colors from the color schema of the previous layer. This way, all series of the Charts window have different colors and can therefore be distinguished more easily.

You can break this link on any additional layer that you add and choose a different color schema that then can also be re-used in subsequent layers.

Color Range

In gauge charts, you can customize the appearance of the gauge by applying colors to certain value ranges.

Starting from	Fill with color	Color	
0	☒		Add Delete
20	☒		
40	☒		
60	☒		
80	☒		

The definition shown in the screenshot above will appear in the gauge charts as follows:

10.2.4 X-Axis

In the X-axis section of the **Change Appearance** dialog box, you can enter a label for the axis, and define colors for the axis and the grid lines (if displayed). You can also define whether or not you want to display tick marks and axis values. This section is the same for all bar, line, area, and candlestick charts.

Label

Line

Gridlines
☐ Show Gridlines 

Tick Drawing
☒ Show Ticks
☒ Show Values

Axis Position

Left/Bottom

 At Value / On Category Number:

In Value Line Charts however, you can also define the value range, and define at what interval

tick marks should be displayed.

The image shows a configuration dialog box for a chart's X-axis. It contains several sections: 'Label' with a text input field; 'Range' with 'Auto' and 'Manual' radio buttons, an 'Include Zero' checkbox, and 'Min'/'Max' input fields; 'Line' with a color selection dropdown; 'Gridlines' with a 'Show Gridlines' checkbox and a color dropdown; 'Tick Interval' with 'Auto' and 'Manual' radio buttons and an input field; 'Tick Drawing' with 'Show Ticks' and 'Show Values' checkboxes; and 'Axis Position' with a 'Left/Bottom' dropdown and an 'At Value / On Category Number' input field.

Label

The text entered into the `Label` field will be printed below the axis as a description of the X-axis.

Range

By default, the `Auto` radio button is selected in the Range group box. If you want to display a fragment of the chart in greater detail, activate the `Manual` radio button and enter minimum and maximum values into the respective fields.

If the column that is used for the X-axis does not include zero, you can deactivate the `Include zero` check box and the X-axis will start with the minimum value that is available in the series.

Line

The axis is displayed in the color that you choose from the `Line` drop-down-list. You can use one of the preselected colors, or click the **Other color...** button to choose a standard color or define a custom color. Click the **Select...** button on the Custom tab and use the pipette to pick a color that is displayed somewhere on your screen.

Grid lines

If the `Show Grid lines` check box is activated, you can choose a color from the corresponding drop-down list box.

Tick Interval

If you are not satisfied with the default tick marks, you can activate the `Manual` radio button in the Tick Interval group box and enter the difference between the individual tick marks into the corresponding field.

Tick Drawing

You can switch the display of tick marks on the axis and/or axis values on or off.

Axis Position

From the drop-down list, you can choose the position where the axis is to be displayed. When selecting "At Value / On Category Number", you can also position the axis anywhere within the plot.

10.2.5 Y-Axis

In the Y-axis section of the **Change Appearance** dialog box, you can enter a label for the axis, define colors for the axis and the grid lines (if displayed), define the value range, and decide if and where tick marks should be displayed and whether or not you want to show the axis values. This section is the same for all bar and line charts.

The screenshot shows the Y-axis configuration section of the 'Change Appearance' dialog box. It contains several sections with labels in blue text:

- Label:** A text input field.
- Range:** Includes radio buttons for 'Auto' (selected) and 'Manual'. The 'Manual' option has 'Min:' and 'Max:' input fields. A checked checkbox labeled 'Include Zero' is also present.
- Line:** A color selection dropdown menu.
- Gridlines:** A checked checkbox labeled 'Show Gridlines' and a color selection dropdown menu.
- Tick Interval:** Includes radio buttons for 'Auto' (selected) and 'Manual'. The 'Manual' option has an input field.
- Tick Drawing:** Includes checked checkboxes for 'Show Ticks' and 'Show Values'.
- Axis Position:** Includes a dropdown menu with 'Left/Bottom' selected and an input field labeled 'At Value / On Category Number' with the value '0'.

Label

The text entered into the `Label` field will be printed to the left of the axis as a description of the Y-axis.

Range

By default, the `Auto` radio button is selected in the Range group box. If you want to display a fragment of the chart in greater detail, activate the `Manual` radio button and enter minimum and maximum values into the respective fields.

If the column that is used for the X-axis does not include zero, you can deactivate the `Include zero` check box and the X-axis will start with the minimum value that is available in the series.

Line

The axis is displayed in the color that you choose from the `Line` drop-down-list. You can use one of the preselected colors, or click the **Other color...** button to choose a standard color or define a custom color. Click the **Select...** button on the Custom tab and use the pipette to pick a

color that is displayed somewhere on your screen.

Grid lines

If the `Show Grid lines` check box is activated, you can choose a color from the corresponding drop-down list box.

Tick Interval

If you are not satisfied with the default tick marks, you can activate the `Manual` radio button in the Tick Interval group box and enter the difference between the individual tick marks into the corresponding field.

Tick Drawing

You can switch the display of tick marks on the axis and/or axis values on or off.

Axis Position

From the drop-down list, you can choose the position where the axis is to be displayed. When selecting "At Value / On Category Number", you can also position the axis anywhere within the plot.

10.2.6 Z-Axis

In the Z-axis section of the **Change Appearance** dialog box, you can enter a label for the axis, define colors for the axis, and decide whether or not you want to show tick marks on the axis. This section is the same for all 3d bar charts (Bar Chart 3d and Bar Chart 3d Grouped).

Label

The text entered into the `Label` field will be printed to the right of the axis as a description of the Z-axis.

Line

The axis is displayed in the color that you choose from the `Line` drop-down-list. You can use one of the preselected colors, or click the **Other color...** button to choose a standard color or define a custom color. Click the **Select...** button on the Custom tab and use the pipette to pick a color that is displayed somewhere on your screen.

Tick Drawing

You can switch the display of tick marks on the axis on or off.

10.2.7 3d Angles

In 3d bar charts you can customize the 3d appearance of the chart in the 3d Angles section of the **Change Appearance** dialog box.

The `Tilt` value determines the rotation around the X-axis, whereas the `Rotation` value defines the rotation around the Y-axis. You can automatically adapt the size of the chart axis to the Chart window width by activating the corresponding check box.

If the `Automatic Chart Axis Size` check box is activated, DatabaseSpy will automatically calculate the optimum size of the X-axis as well as the Y-axis for the current Chart window size. The width and height of the chart will change dynamically when you resize the Chart window.

10.2.8 Sizes

In the **Sizes** section of the **Change Appearance** dialog box, you can define different margins as well as the size of axis and gauge ticks. Note that not all the properties listed below are available for all chart types.

General

Outside margin	Space between the plot and the edge of the Chart window.
Title to Plot	Space between the chart title and the upper edge of the plot.
Legend to Plot	Space between the lower edge of the plot and the legend.

Pie

Plot to Label	In pie charts, the space between the most left and right edge of the pie and its labels.
Pie Height	In 3d pie charts, the height of the pie.
Pie Drop Shadow	In 3d pie charts, the length of the shadow (if it is activated in the Pie section).

X-Axis

X-Axis to Axis Label	In bar and line charts, the space between the X-axis and its label.
X-Axis to Plot	In 2d bar charts and line charts, the space between the X-axis and the plot.
X-Axis Tick Size	In bar and line charts, the length of the ticks on the X-axis.

Y-Axis

Y-Axis to Axis Label	In bar and line charts, the space between the Y-axis and its label.
Y-Axis to Plot	In 2d bar and line charts, the space between the Y-axis and the plot.
Y-Axis Tick Size	In bar and line charts, the length of the ticks on the Y-axis.

Z-Axis

Z-Axis to Axis Label	In 3d bar charts, the space between the Z-axis and its label.
Z-Axis Tick Size	In 3d bar charts, the length of the ticks on the Z-axis.

Line Drawing

Connection Shape Size	In line charts, the size of the squares that mark the values in the chart.

3d Axis Sizes

Manual X-Axis Size of Base	In 3d bar charts, defines the relation between the length of the X-axis and the Chart window size. Please note that the <code>Automatic Chart Axis Size</code> check box in the 3d Angles section must be deactivated, otherwise the size will still be calculated automatically.

Manual Y-Axis Size of Base	In 3d bar charts, defines the relation between the length of the Y-axis and the Chart window size. Please note that the <code>Automatic Chart Axis Size</code> check box in the 3d section must be deactivated, otherwise the size will still be calculated automatically.
Z-Axis Series Margin	In 3d bar charts, the distance on the Z-axis between the individual series.
Gauge	
Border Width	In round gauge charts, the width of the border around the gauge.
Gauge Ticks	
Border to Tick Distance	In round gauge charts, the space between the inner edge of the border and the ticks that mark the values.
Major Tick Length	In round gauge charts, the length of the major ticks (i.e., ticks that show a label).
Major Tick Width	In round gauge charts, the width of the major ticks (i.e., ticks that show a label).
Minor Tick Length	In round gauge charts, the length of ticks that do not have a value displayed.
Minor Tick Width	In round gauge charts, the width of ticks that do not have a value displayed.
Gauge Needle	
Needle Length	In round gauge charts, the length of the needle. (Note the the percentage is calculated from the diameter of the gauge, so if you choose a value greater that 50%, the needle will point to somewhere outside the gauge!)
Needle Width at Base	In round gauge charts, the width of the needle at the center of the gauge.
Needle Base Radius	In round gauge charts, the radius of the base that covers the center of the gauge.
Gauge Color Range	
Border to Color Range Distance	In round gauge charts, the space between the inner edge of the border and the outer edge of the color range .
Color Range Width	In round gauge charts, the width of the customizable color range. (Note that the percentage is calculated from the diameter of the gauge!)

10.2.9 Fonts

The Fonts section of the **Change Appearance** dialog box lets you configure fonts for objects in the Chart window.

Font settings

You can choose the font face, size, and style for the individual elements displayed in the Chart window. You can define the size as a percentage of the chart size and define a minimum size in points, or specify an absolute value (in points). To apply the same font and/or size to all text elements, activate the respective `Use the same for all` check box.

The element names in the list box are defined as follows:

- **Title:** The name of a chart
- **Legend:** The key to the colors used in the chart
- **Labels:** The designation of the pies of a pie chart
- **Axis Title:** The name of the X, Y, and Z axis in a bar or line chart
- **Axis Values:** The units displayed on an axis in a bar or line chart
- **Tick Values:** The units displayed on a gauge chart

10.3 Choosing the Chart Data

The **Select Data** dialog box allows you to add and delete series as well as to define the column or data range that should be illustrated by a particular series. The available columns are displayed in a list box at the bottom of the dialog box. You can add and remove columns by clicking the **Select Columns** button and activate the required columns in the **Select columns** dialog box that appears (note that columns can only be added to, or removed from, this dialog box via the Result window).

In the Axis Values group box, you can define a column, row, or data range that is used as an X-axis for all series. To specify the column, row, or data range for the Y-axis, select a Series in the Series group box and then click into the Y (selected series) field in the Axis Values group box. An asterisk appears next to the field to mark it as the field that can be edited.

In Value Line Charts, you can add an additional X-axis for the selected series if, for example, the X-axes of two series do overlap but do not match entirely. Then the additional axis can be laid over the default axis, which allows to display the data in the correct place.

For Candlestick Charts please note that the sequence of the series is important in order to display the chart correctly. A corresponding note is displayed in the **Select Data** dialog box.

Series

open
high
low
close

AddDelete

Axis Values

X (all Series):

A

Y (selected series):

B *

Candlestick charts require 3 or 4 series of values:
3 series: high, low, close
4 series: open, high, low, close

Adding, deleting, and renaming series

The Series group box shows all the data series that are currently included in the chart. You can rename a series by clicking its name in the group box and enter the new name. A series can be removed from the chart by clicking the **Delete** button. To add a series to the chart, click the **Add** button, enter a descriptive name, and assign a column, row, or data range to the Y-axis.

To add a series to a chart:

1. Make sure that the column you want to display in the chart is listed in the list box at the bottom of the dialog box.
2. Click the **Add** button in the Series group box and give the new series a descriptive name.
3. Click into the Y (selected series) field to select it for editing.
4. In the list box below, click into the column, row, or data range you want to assign to the series (or type the corresponding letter into the Y (selected series) field. You can also select a single value or a value range from the list box.
5. In Value Line Charts, optionally assign an individual X-axis in the same way.
6. Optionally, click the **Apply** button to see a preview of the new series.

7. Click **OK**.

10.4 Chart Overlays

For some chart types (Bar Chart, Stacked Bar Chart, Line Chart, Area Chart, Stacked Area Chart, and Candlestick Chart), you can display several charts as overlays in one Charts window. This way you can combine charts of different type containing data even from different databases in one Charts window.

A separate Y axis will be displayed for each overlay chart and can be labeled. Note that an overlay will always be displayed in front of the existing chart(s), you should, therefore be careful if you combine different chart types in one Charts window as, for example, area charts displayed as overlay may hide bar or line charts. By default, subsequent colors from the color schema of the Main chart will be used for the overlay. You can, however, also deactivate the `Use subsequent colors from previous chart layer` radio button in any layer and define a different color schema for this particular layer. Note that this color schema will be used for subsequent layers if these have the `Use subsequent colors from previous chart layer` radio button activated.

Chart overlays are managed by clicking the **Overlays** button in the menu bar of the Charts window; this will open the **Overlays** menu where you can add and remove overlays and select the active chart. Note that any changes you make to chart type and/or appearance, and in the **Select data** dialog box apply only to the active chart! **Tip:** You can use [targets](#) for the SQL statements that retrieve the source data of the charts; this way it is easier to identify the various layers in the **Overlays** menu (see screenshot below).

To create a chart overlay:

1. Create a chart (the Main Chart).
2. In the Charts window, click the **Overlays** button and choose **Append** from the drop-down menu.
3. Do one of the following:
 - Create a new chart from the existing Result window.
 - Create a new query in an SQL Editor window or from the Online Browser and click the **Show data in Chart window**  button.

The new chart is displayed as overlay of the existing chart(s) in the same Charts window.

4. In the **Change Type** dialog box, which appears automatically for the first overlay of each tab in the Charts window, define the type of the overlay chart.
5. Optionally, change the appearance of the overlay chart.

To remove a chart overlay:

1. In the Charts window, click the **Overlays** button and, in the drop-down menu, select the chart that you want to remove.
2. Select **Delete Current** from the **Overlays** menu.

Changing the chart type of the Main chart

When you have selected the Main chart as the active chart, you can change the chart type also to types that do not support overlays (i.e., pie charts and gauge charts as well all types of 3d charts). In such a situation all overlays will be removed from the Charts window and DatabaseSpy displays a warning message.

10.5 Exporting Charts

The toolbar of the Charts window provides the **Export** button which, when clicked, opens a sub-menu with the following options:

- **Save chart in file...:** Opens the **Image Size** dialog box where you can enter the height and width of the image in pixels. Upon clicking **OK**, the **Save As** dialog box is displayed where you can specify a name and path for the image file and choose from among several image types (such as PNG, BMP, GIF, and JPG).
- **Copy current image to clipboard:** Copies an image of the chart to the clipboard; the content of the clipboard can then be pasted into an external application such as Paint. Note that the chart will be copied exactly as it is displayed in the Charts window, so you would have to adjust the size before you execute the copy or use the option **Copy resized image to clipboard**.
- **Copy resized image to clipboard...:** Opens the **Image Size** dialog box where you can enter the height and width of the image in pixels. Upon clicking **OK**, the image is resized before it is copied to the clipboard.
- **Print this chart...:** Sends the content of the Charts window to a printer.

Printing a chart

When printing charts in DatabaseSpy, you can specify how much of the page size the chart should occupy. After you have selected the **Print this chart...** command a **Print** dialog box is displayed where you can enter the percentage of page height and width.

After you have clicked **Print**, the **Print** dialog box for your printer is displayed where you can change the properties (orientation, paper format, etc.) if needed. The chart will be printed with the name of the result grid where the data originates from, DatabaseSpy logo, date and time in the header.

Some chart settings require transparency for drawing the chart which may cause problems on printing. You can automatically set the following options to printing compatible settings before the print is started:

- Transparency for pie charts and area charts: transparency will be set to 0 for printing
- Dropshadow on nonsolid background in 3d pie charts: dropshadow will be deactivated for printing

A corresponding dialog box pops up where you can choose to change the settings or print the chart with the existing settings.

10.6 Reloading the Source Data

If the result grid that has been used to create a particular chart has changed since the chart was originally generated, the source data has to be reloaded. This can be done either automatically or by clicking the **Reload** button in the Chart window toolbar. The content of a result grid may change because it is in the Editing mode and the data has been edited—such changes will be depicted in the chart immediately if the **Auto** toggle is activated—or because the result grid has been closed or the underlying SQL script has been changed and/or re-executed.

If the name of a result grid changes, the connection to the chart is broken and DatabaseSpy displays the **Select Result grid** dialog box when you click the **Reload** button or when automatic reloading occurs.

Choose one of the available result grids and click **OK**.

Chapter 11

Working with SQL

11 Working with SQL

For working with SQL scripts, DatabaseSpy provides the **SQL Editor** which you can use to create, display, [edit](#), and [execute](#) the SQL statements that are required for your database work. You can save SQL scripts that you have created in the SQL Editor and add them to your project. In addition, you can also [open existing SQL files](#) and display them in the SQL Editor.

DatabaseSpy's SQL Editor allows you to create views directly from SQL statements in an editor window and provides [toolbars](#) for easy text editing and different display options. You can use SELECT statements to [export only a subset of data](#) from the database.

The appearance of the SQL statements in the SQL Editor can be [configured](#) in the **SQL Formatting Configurations** dialog box. You can access this dialog box from within the [Formatting](#) page of the **Options** dialog box.

The SQL Editor is started automatically when you [open an SQL file](#) or [generate a statement from an existing database object](#); apart from that, you can always open a new SQL Editor window by clicking the **SQL Editor**  icon in the Standard toolbar or by choosing the menu option **File | New | SQL Editor (Ctrl+N)**. This is also possible if no data source is currently connected. As soon as an SQL Editor window is active, also the [SQL Editor](#) menu and [toolbars](#) are available. In addition, each SQL Editor window has a [toolbar of its own](#) which provides buttons for executing SQL as well as various selection and display options.

You can now type in SQL statements manually using DatabaseSpy's autocompletion feature or [drag an existing database object into the SQL Editor window](#) to create an SQL statement automatically.

To open a new SQL Editor from the Standard toolbar:

- Click the **SQL Editor**  icon in the Standard toolbar, or select the menu option **File | New | SQL Editor**, or press **Ctrl+N**.
A new empty SQL Editor window opens.

Please note: A new SQL Editor window is automatically connected to the active data source, i. e., the data source that is connected to the window where the cursor was located before you clicked the **SQL Editor** icon. If there is no data source connected, the SQL Editor window is in the Offline state which allows you to create SQL statements independent from any database connection. You can change the data source to which an SQL Editor window is connected in the Properties window. Click into an SQL Editor window to view its properties in the Properties window.

To assign a data source to an SQL Editor window:

1. Click into the SQL Editor window whose properties you want to change.
2. If the [Execution Target Bar](#) is displayed in the SQL Editor window, click the `Unknown` or `Offline` hyperlinks to jump to the `Database Kind` or `Data Source` fields in the Properties window.
3. In the Properties window, select the data source, root object, and the filter for the schema used in autocompletion from the respective drop-down lists.
4. If you want the SQL statements to be executed as separate batches, or if you plan to use [target keywords](#) in this SQL Editor window, be sure to choose either "Semicolons" or "SQL Grammar" from the `Group statements for execution with` check box.

Editing SQL

You can edit SQL statements in the SQL Editor like in any other text editor. In addition, the SQL Editor provides features such as [autocompletion](#), [comments](#), [naming of result tabs](#), [bookmarks](#), and [regions](#) which facilitate the work with SQL scripts.

The following buttons in the SQL Editor window allow you to select text, depending on where the cursor is positioned.

Next statement (Alt+Down): Selects the statement after the statement where the cursor is currently located.

Previous statement (Alt+Up): Selects the statement before the statement where the cursor is currently located.

Last statement (Alt+End): Selects the last statement in the SQL Editor.

First statement (Alt+Home): Selects the first statement in the SQL Editor.

Current statement (Shift+Alt+Enter): Selects the statement where the cursor is currently located. Alternatively, you can also triple-click into a statement or click into any of the margins, if visible.

In addition, the following text editing commands are available in context menu that opens when you right-click anywhere into an SQL Editor window:

Cut (Shift+Del): Deletes the selected text and copies it to the clipboard.

Copy (Ctrl+C): Copies the selected text to the clipboard.

Paste (Ctrl+V): Pastes text from the clipboard to the place where the cursor is positioned in the SQL Editor window.

Delete (Del): Deletes the selected text.

All other SQL commands related to the SQL Editor are also available in the context menu.

11.1 Generating SQL Statements

In DatabaseSpy, you can automatically generate SQL statements based on existing tables and columns in the Online Browser. You can either [drag a database object](#) from the Online Browser into an open SQL Editor window or use the [options in the context menu](#) that opens when you right-click a database object in the Online Browser.

When generating SELECT statements by (i) [dragging and dropping](#) a table into an open SQL Editor window, (ii) using the [Retrieve data](#) commands, or (iii) [showing in new SQL Editor window](#), you can define in the [SQL Generation](#) options, whether the statement should include an asterisk or the full column list. If you have deactivated the `Generate SELECT statements with full column list` check-box, you can still add the column list. When you place the cursor behind the asterisk, a tooltip is displayed that offers guidance on this matter.

To generate SELECT statements without full column list:

1. Select the menu option **Tools | Options...** or press **Ctrl+Alt+O** to open the **Options** dialog box.
2. On the **Generation** page, deactivate the `Generate SELECT statements with full column list` check box, if you prefer statements of type `SELECT * FROM ...` when querying all columns of a table.

When you have deactivated the generation of SELECT statements with full item list in the [SQL Generation](#) options, you have several options to fine-tune the SELECT statement in the SQL Editor.

- **Inserting the full column list**

The **SQL Refactoring** menu provides the **Expand columns for star expressions** option, which allows you to replace the asterisk in a SELECT statement with the full column list when the cursor is positioned after the asterisk. Provided that the `Expand columns with tab` option is checked in the [Autoinsertion](#) options, you can also insert the full column list by placing the cursor after the asterisk and hitting the **Tab** key. The SQL statement must be complete and valid in both cases, that is, if the `SQL Editor should require semicolons` option is checked, for example, the terminating semicolon must indeed be present in the SQL Editor.

- **Selecting specific columns**

If you decide to query just some of the columns of a table for which you have generated a SELECT statement, you can hit **Ctrl+Space** when the cursor is located right behind the asterisk.

An autocomplete popup appears where all columns of the table are listed. Uncheck the columns that you do not want to include in your query and hit any of the keys defined as completion keys in the [Autocompletion](#) options (e.g., **Enter** or **Tab**).

You can sort the columns in the autocomplete popup by clicking the title bar of the Name or Path columns. The columns are retrieved in the order in which they appear in the popup.

Drag and Drop

When you drag a table or column and drop it into an open SQL Editor window, a SELECT statement will be generated by default. You can change this default setting for any database object in the [Online Browser options](#).

Example: When you drag the `Address` column of table `tblZookeepers` from the Online Browser into an open SQL Editor window, the following statement will be generated:

Note that you can define several options that determine how the generated SQL statement appears in the SQL Editor. In the screenshot above, the `Append semi-colons to statement end` has been activated in the [SQL Generation](#) options and the `Enable SQL Formatting for the SQL Editor` has been deactivated in the [SQL Formatting](#) options.

Executing the statement in the above screenshot retrieves all the data in the `Address` column of the table `tblZookeepers`.

To generate SQL statements using drag and drop:

- Drag and drop one or several database objects from the Online Browser into an existing SQL Editor window. An SQL statement appears in the SQL Editor. Note that one statement per table will be generated if you select objects from different tables.

You can also right-click a database object and drag it into an open SQL Editor window. When you release the mouse button, a popup menu opens from which you can choose the desired option.

To generate SQL statements using drag right:

1. Right click one or several database objects in the Online Browser and use drag right to

drop the object(s) into an existing SQL window.

A popup appears allowing you to define the type of SQL statement you want to generate.

2. Select the type of SQL statement you want to generate from the menu, e.g., CREATE or ALTER.

The statement(s) appear(s) in the SQL Editor window.

Showing in new SQL Editor window

If you want your SQL statements generated in a new SQL window, you can use the context menu to achieve this. This method automatically opens an SQL window, you do not have to use an existing SQL editor window.

To generate SQL statements using the context menu:

1. Right-click a database object in the Online Browser and select **Show in new SQL Editor** from the context menu.
2. From the sub-menu, select the appropriate statement you want to use, e.g., SELECT, INSERT, etc.

A new window containing the statement opens in the SQL Editor.

The context menu that appears when you either right-click a database object (table, column, key, index, trigger, view, procedure, or function) in the Online Browser and choose **Show in new SQL Editor** or drag the database object into an SQL Editor window provides several options for generating SQL statements. The table below shows which options are available for the different database objects.

Select			-	-	-		-	-
Name								
Path								
Create		-	-					
Drop								
Add	-			-	-	-	-	-
Alter	-							
Rename			-	-	-		-	-
Insert			-	-	-		-	-
Update			-	-	-		-	-
Delete data		-	-	-	-		-	-
Execute	-	-	-	-	-	-		-

Please note: The syntax of the statements may vary depending on the database kind you are using.

Select Creates a SELECT statement that retrieves data from (i) all columns of the source table, (ii) the selected column(s) of the parent table, or (iii) all columns that are included in a view. Basically, this is the same procedure as when selecting [Retrieve data](#) from the context menu, however the query is not automatically executed in this case.

Name Returns the name of the selected database object. You can also select several objects. The names are printed in individual lines, separated by commas.

Path	Returns the full path of the selected database object (e.g., DatabaseName.SchemaName.TableName.ColumnName). You can also select several objects. The paths are printed in individual lines, separated by commas.
Create	Generates a CREATE statement based on the selected database object. Depending on the selected database object, you have to edit this statement as follows: • Edit the index name as well as the properties, and enter the appropriate column to create a new index for the parent column of the selected index. • Edit the trigger name as well as the table that invokes the trigger, and enter the action that is to be triggered. • Edit procedure name and parameters, and adapt the body accordingly to create a new stored procedure. • Edit the function name as well as the body of the function. Define additional or remove parameters, if required.
Drop	Creates a DROP or ALTER statement, respectively, that deletes the selected database object from the database.
Add	Generates an ALTER statement that (i) adds a new column to the parent table of the selected column and uses the name and definition of the selected column as default values, or (ii) adds a constraint and uses the properties of the selected constraint as default. The default values have to be edited.
Alter	Generates an ALTER statement that allows you to edit the properties of the selected database object.
Rename	Allows you to rename the selected table, column, or view. In SQL Server 2000, for example, this command generates an SP_RENAME statement for a table and adds the current table name as parameter for the new name. Change this parameter to the desired new table name. Please note: This command is not available for Microsoft Access databases.
Insert	Allows you to insert data into the selected table, column, or view. By default, no default values specified. You must edit the statement and specify the values that are to be inserted into the table. When inserting data into individual columns, or if the primary key is not included in the view, you must also specify a value for the primary key unless an IDENTITY statement has been used for auto-generation of a primary key when the table was created.
Update	Creates an UPDATE statement that updates (i) all columns of the selected table, (ii) the selected column, or (iii) the columns that are included in the selected view. No default is specified for the new values. Note that this command will update all rows with the same values if no WHERE statement is added to select a specific row.
Delete data	Generates a DELETE statement that deletes data (i) from the selected table and adds a WHERE clause using the table's primary key to specify the row to be deleted, or (ii) from the parent table of the selected view. Note that this command will delete all rows of the table if no WHERE statement is added.
Execute	Declares the parameters needed for execution and creates an EXEC statement that executes the stored procedure with the required parameters.

11.2 Opening, Saving, and Closing SQL Files

Any file that is stored in the file system can be opened via the **File | Open** menu (**Ctrl+O**) and will be displayed under its file name in a new SQL Editor window.

```
1  -- target: AnimalTypeCountQuery
2  SELECT COUNT (ZooDB.dbo.tblAnimalTypes.EnglishName)
3  FROM ZooDB.dbo.tblAnimalTypes, ZooDB.dbo.
   tblAnimalCategories
4  WHERE ZooDB.dbo.tblAnimalTypes.Category=ZooDB.dbo.
   tblAnimalCategories.CategoryID AND
5  ZooDB.dbo.tblAnimalCategories.Category='perch-like';
6
7  -- target: AnimalNameQuery
8  SELECT EnglishName, LatinName
9  FROM ZooDB.dbo.tblAnimalTypes
```

animalType_queries.sql

If an SQL file that has already been added to the project, it can be opened from the Project window and will be displayed under its file name in a new SQL Editor window. A file that has been added to the [Global Resources](#) can be opened via the **File | Open | Open Global Resource...** menu and will be displayed under its Alias name in a new SQL Editor window.

To open an SQL file:

Do one of the following:

- Select the menu option **File | Open | Open File...** or press **Ctrl+O**. The standard Windows **Open** dialog box appears. Select an SQL (*.sql) file and click **Open**.
- In the Project window, in the SQL folder do one of the following:
 - Select an SQL file and double-click the file name.
 - Right-click the file and select **Open** from the context menu.

The SQL file is displayed in a new SQL Editor window.

To open a global resource

Do one of the following:

- Select the menu option **File | Open | Open Global Resource...** to display the **Choose Global Resource** dialog box and do one of the following:
 - Select a file-type global resource under the Files directory and click **OK**. The file is displayed under its Alias name in a new SQL Editor window.
 - Select a folder-type global resource under the Folders folder and click **OK**. The standard Windows **Open** dialog box appears and displays the content of the directory that is defined for the active configuration. Select a file and click **Open**. The file is displayed under its file name in a new SQL Editor window.
- Alternatively, do the following:
 1. Select the menu option **Tools | Global Resources** or, in the Global Resources toolbar, click the **Manage Global Resources**  button.
 2. Under the Files folder, click the Alias name of the SQL file you want to open.

3. Click the **View** button. The file is opened with the configuration that is selected in the drop-down list of the Global Resources toolbar. If the selected configuration is not applicable, the SQL file opens with the Default configuration.

Reparsing

It may occur that a script contains parsing errors when it is first displayed in the SQL Editor. If, for example, the execution blocks are not set correctly, such a script would produce an error when being executed. (To check the execution blocks, toggle on the **Show groupings for execution**  icon.) Also the syntax highlighting may not be displayed correctly when the script is initially parsed or edited by the user. To correct such errors, the SQL Editor toolbar provides the **Reparse the whole document**  button.

To correct a SQL script with parsing errors:

- In the SQL Editor toolbar, click the **Reparse the whole document**  button.

Saving and closing

DatabaseSpy offers several options for saving SQL statements in, or closing one or several windows of, the SQL Editor:

- **Save:** saves the contents of the active window to the file from which it has been opened.
- **Save As:** pops up the familiar Windows **Save As** dialog box, in which you enter the name and location of the file you wish to save the active file as.
- **Save All:** saves all modifications that have been made to any open documents.
- **Close:** closes the active window.
- **Close All:** closes all open windows.
- **Close All But Active:** closes all open windows but leaves the active file open in the SQL Editor.

For all Close commands, if the file was modified (indicated by an asterisk * after the file name in the title bar), you will be asked if you wish to save the file first.

All commands except **Close All But Active** are available in the **File** menu, and all commands that affect only one particular window are included in the context menu that opens when you right-click the tab of the respective SQL Editor window.

In addition to the menu commands listed above, you can also use the keyboard shortcut **Ctrl+S** to save the active SQL file.

Saving SQL scripts

You can save any SQL that appears in an SQL Editor window and re-use the script later on. If the content of an SQL Editor window has already been saved, the file name appears in the title bar of the SQL Editor window. Unsaved files can be identified by the asterisk to the right of the generic title in the title bar.

A saved SQL script can be made available for all Altova applications by [defining it as a global resource](#). Global resources can be used in all Altova applications that share the same [Global Resources XML File](#).

To save the content of an SQL Editor window to a file:

1. Do one of the following:
 - Right-click the tab of the respective SQL Editor window and choose **Save...** from the context menu.
 - Make the SQL Editor window you want to save the active window and press **Ctrl+S**.
2. If you save the file for the first time, choose a name and path for the file in the **Save As...** dialog box and click **Save**.

To save an SQL file under a new name:

1. Right-click the tab of the respective SQL Editor window and choose **Save As...** from the context menu.
2. In the **Save As...** dialog box, choose a new name and path for the file and click **Save**.

11.3 Formatting SQL

The appearance of SQL code can be customized separately for each database kind that is supported by DatabaseSpy. In the [SQL Formatting](#) page of the **Options** dialog box, you can furthermore disable this formatting for the SQL Editor and/or the Database Structure Change Script window. Both check boxes are activated by default.

Any changes you make to the default formatting are recorded in a configuration file. This file is stored under My Documents\Altova\DatabaseSpy2012\SQLFormattingConfigurations.qfmt. Please note that the configuration file is not automatically transferred during upgrades if the installation folder changes. After upgrading to a new major version, you have to copy the configuration file to the new installation folder (My Documents\Altova\DatabaseSpy<Version>) yourself.

Please note: As of version 2009, a new version number is used for configuration files. Therefore, configurations that have been saved in DatabaseSpy 2009 **cannot be opened in earlier releases!**

The formatting is applied when you generate SQL by dragging database objects from the Online Browser into an SQL Editor window or using the **Show in new SQL Editor** context menu option. In addition, you can always click the **Apply SQL Formatting to the active SQL Editor**  button.

You can format the way SQL code is displayed separately for a variety of database kinds. The following options are available in the drop-down list of the Configurations group box in the **SQL Formatting Configurations** dialog box:

- IBM DB2 8 and greater
- IBM iSeries 5.4 and greater
- MS Access 2003 and greater
- MS SQL Server 2000
- MS SQL Server 2005 and greater
- MS SQL Server 2008
- My SQL 4
- My SQL 5 and greater
- Oracle 9 and greater
- Oracle 11
- Sybase 12 and greater
- PostgreSQL 8.3 and greater
- Any Other Database (ANSI 2003 syntax)

The **SQL Formatting Configurations** dialog box displays a tree structure which allows you to define either the general formatting options on root level or specify formatting options more specifically for the individual statement types.

In the Preview group box, the options are immediately applied to a sample statement. Selecting a specific statement type in the tree structure displays the relevant part of the sample statement in the Preview group box.

Options on root level

If you select the root level of a database type, you can either deactivate the formatting options for this individual database type (without deactivating the SQL formatting feature as a whole!), or define which case should be used for identifiers, functions, and keywords, when to add spacing and blank lines, and how far text should be indented.

To deactivate SQL formatting for a certain database kind:

1. Select the menu option **Tools | Options** or press **Ctrl+Alt+O** to open the **Options** dialog box and click the **SQL Formatting Configurations...** button on the SQL Formatting page.
2. In the **SQL Formatting Configurations** dialog box, select the respective database kind from the drop-down list in the Configurations group box.
3. In the Options section, activate the **Ignore All** check box.

Options for the individual statement types

When you select one of the statement types in the tree structure, the corresponding formatting options are displayed in the window on the right side of the dialog box. Different options are available for the individual statement types.

The header of the options list provides an icon on the right edge that displays the properties inherited from the root level. If you click the **Show inherited properties**  icon, the options from the root level are displayed and you can change the settings for the selected statement type. Note that these changes apply only to the selected statement type; for all other parts of the statements, the settings defined on the root level are still valid! Options that differ from those defined on root level appear in bold type. These options remain also visible if you click the **Hide inherited properties**  button.

You can customize the display of the following statement types:

- **Select** (all databases)

Statement
New line before ORDER BY
Select Items List
First item on new line
Subsequent select list items on new lines
FROM Clause
New line before FROM
First table source on new line
Subsequent table sources on new lines
WHERE Clause
New line before WHERE
First search condition on new line
Subsequent search conditions on new lines

- **Create Table** (all databases)

Statement
First column/key/index/etc. on new line
Subsequent columns/keys/indices/etc. on new lines
New line before the table definition

- **Create Function**

Statement
Indent contents

This option is **not** available for MySQL databases.

- **Alter Table** (all databases)

Statement
New line before (ADD) CONSTRAINT
New line before FOREIGN KEY
New line before REFERENCES
New line before PRIMARY KEY

- | |
|------------------------|
| New line before UNIQUE |
|------------------------|
- | |
|----------------------------------|
| Alter Function |
| Statement |
| Place BEGIN and END on new lines |
| Indent contents |

This option is **only** available for Access, SQL Server, and Sybase databases.
 - | |
|---|
| Update (all databases) |
| Columns List |
| New line before columns list |
| First column on new line |
| Subsequent columns on new line |
| WHERE Clause |
| New line before WHERE |
| First search condition on new line |
| Subsequent search conditions on new lines |
 - | |
|--------------------------------|
| Insert (all databases) |
| Columns List |
| New line before columns list |
| First column on new line |
| Subsequent columns on new line |
| Values List |
| New line before values list |
| First value on new line |
| Subsequent values on new line |
 - | |
|----------------------------|
| Create Procedure |
| General Formatting |
| Disable all formatting |
| New line before definition |

This option is **not** available for MySQL 4 and PostgreSQL databases.
 - | |
|----------------------------|
| Create Trigger |
| General Formatting |
| Disable all formatting |
| New line before definition |

This option is **not** available for MySQL 4 databases.
 - | |
|----------------------------|
| Alter Procedure |
| General Formatting |
| Disable all formatting |
| New line before definition |

This option is **only** available for Access, SQL Server, MySQL 5, and Oracle databases.
 - | |
|----------------------------|
| Create View |
| General Formatting |
| Disable all formatting |
| New line before definition |

This option is **not** available for MySQL 4 databases.
 - | |
|----------------------------|
| Alter View |
| General Formatting |
| Disable all formatting |
| New line before definition |

This option is **only** available for Access, SQL Server, MySQL 5, and Oracle databases.
 - | |
|---------------------------------|
| Create Package Name/Body |
|---------------------------------|

General Formatting
Disable all formatting
New line before definition

This option is **only** available for Oracle databases.

Removing formatting and comments

You can remove all additional whitespace and line feeds that have been added by the **Format SQL** command or because of the default setting for formatting SQL in the [SQL Formatting options](#). The menu option **SQL Refactoring | Remove Comments and Formatting** not only deletes all these characters but also removes any text that is located between [block comments](#) or after [line comments](#).

1	SELECT · [ID] , LF	1	SELECT · [ID] , [Name] ,
2	····· [Name] , LF		[CountryCode] , [Population]
3	····· [CountryCode] , LF		FROM · [sandbox] . [World] .
4	/* ····· [District] , */ LF		[City] ; ·
5	····· [Population] LF		
6	FROM ··· [sandbox] . [World] . [City] ; ·		

The left pane shows a SELECT statement when SQL formatting is enabled in the [SQL Formatting options](#) and the Whitespace markers and End-of-Line markers options are activated in the [Text View Settings](#). The right pane shows the same statement with the same options after the **Remove Comments and Formatting** command has been selected.

Removing comments

If you want to get rid of all that text in your statement that has been commented out, you can use the **Remove comments** option in the **SQL Refactoring** menu. Any text that is enclosed by [block comment](#) characters or appears after a [line comment](#) will be deleted from the active SQL Editor window (see screenshot below).

1	SELECT · [ID] ,	1	SELECT · [ID] ,
2	····· [Name] ,	2	····· [Name] ,
3	····· [CountryCode] ,	3	····· [CountryCode] ,
4	/* ····· [District] ,	4	·····
5	*/ ····· -- [Population]	5	FROM ··· [sandbox] . [World] .
6	FROM ··· [sandbox] . [World] .		[City] ; ·
	[City] ; ·		

11.4 Displaying Options

The SQL Editor has visual features to make the display and editing of large sections of text easier. Some very useful features are: (i) [Line Numbers](#), (ii) [Bookmarks](#), (iii) [Source Folding](#) (expanding and collapsing the display of nodes), (iv) [Indentation Guides](#), and (v) [End-of-Line and Whitespace Markers](#). These commands are available in the **Text View Settings** dialog box (*screenshot below*).

The **Text View Settings** dialog box is accessed via the **SQL Editor | Text View Settings** command or the **Text View Settings** button in the [SQL Editor options](#). Settings in the **Text View Settings** dialog box apply to the entire application—not only to the active document.

Another useful feature is the [Zooming](#) function.

Line numbers

Line numbers are displayed in the line numbers margin, which can be toggled on and off in the **Text View Settings** dialog box. When a section of text is collapsed, the line numbers of the collapsed text are also hidden.

Bookmarks

Lines in the document can be separately bookmarked for quick reference and access. This can be useful in very long scripts to mark, for example, a section of particular interest. There are two ways how bookmarks can be displayed in the SQL Editor:

- When the bookmark margin is enabled, blue bookmark icons  are displayed in the margin at the beginning of a bookmarked line.

```
VALUES ('marsupial')
4
5 DECLARE @CategoryID As int
6
7 SET @CategoryID = (SELECT CategoryID FROM
tblAnimalCategories WHERE Category =
'marsupial')
8
9 INSERT INTO tblAnimalTypes (EnglishName,
LatinName, AreaOfOrigin, Category)
10 VALUES ('Parma wallaby', 'Macropus parma',
'Australia', @CategoryID)
11
12 INSERT INTO tblAnimalCategories (Category)
13 VALUES ('bonytongue')
14
15 SET @CategoryID = (SELECT CategoryID FROM
tblAnimalCategories WHERE Category =
'bonytongue')
```

- If the bookmarks margin is not enabled, the bookmarked lines are highlighted in cyan.

```
VALUES ('marsupial')
4
5 DECLARE @CategoryID As int
6
7 SET @CategoryID = (SELECT CategoryID FROM
tblAnimalCategories WHERE Category =
'marsupial')
8
9 INSERT INTO tblAnimalTypes (EnglishName,
LatinName, AreaOfOrigin, Category)
10 VALUES ('Parma wallaby', 'Macropus parma',
'Australia', @CategoryID)
```

The bookmarks margin can be toggled on or off in the **Text View Settings** dialog box.

To toggle the bookmark margin on and off:

- Select the menu option **SQL Editor | Text View Settings** and activate or deactivate the `Bookmark margin` check box.

You can edit and navigate bookmarks using commands in the **SQL Editor** menu and SQL Editor toolbar. Bookmarks can be inserted with the **SQL Editor | Bookmarks | Insert/Remove Bookmark** command, enabling you to mark a line in the document for reference.

To insert/remove a bookmark:

1. Place the cursor in the statement you want to bookmark/remove the bookmark from.
2. Click the **Insert/Remove Bookmark**  button in the SQL Editor toolbar or select the menu option **SQL Editor | Bookmarks | Insert/Remove Bookmark**.

A bookmark can be removed by selecting the bookmarked line and then selecting the **SQL**

Editor | Bookmarks | Insert/Remove Bookmark command.

To remove all bookmarks:

- Click the **Remove All Bookmarks**  button in the SQL Editor toolbar or select **SQL Editor | Bookmarks | Remove All Bookmarks**.

To navigate through the bookmarks in a document, use the **SQL Editor | Bookmarks | Next Bookmark** and **SQL Editor | Bookmarks | Previous Bookmark** commands. These bookmark commands are also available as icons in the SQL Editor toolbar.

To navigate between bookmarks:

Do one of the following:

- To move the cursor to the next bookmark, click the **Next Bookmark**  button in the SQL Editor toolbar or select the menu option **SQL Editor | Bookmarks | Go to Next Bookmark**.
- To move the cursor to the previous bookmark, click the **Previous Bookmark**  button in the SQL Editor toolbar or select the menu option **SQL Editor | Bookmarks | Go to Previous Bookmark**.

Source folding

Source folding refers to the ability to expand and collapse nodes and is displayed in the source folding margin. The margin can be toggled on and off in the **Text View Settings** dialog box.

To toggle the source folding margin on and off:

- Select the menu option **SQL Editor | Text View Settings** and activate or deactivate the **Source Folding Margin** check box.

In the SQL Editor, regions are sections of text that you mark and declare as a unit to structure your SQL scripts. When you insert a region, an expand/collapse icon and a `--region` comment are inserted above the selected text. Make sure that the [source folding margin](#) has been enabled in the SQL Editor to be able to see the icons.

Please note: You can change the name of a region by editing the automatically generated text "region", i.e., by appending a descriptive text. The word "region" must not be deleted!

To create a region:

- In the SQL Editor select the statements you want to make into a region.

```

1 -- target: Result
2 SELECT COUNT (ZooDB.dbo.tblAnimalTypes.EnglishName)
3 FROM ZooDB.dbo.tblAnimalTypes,
4     ZooDB.dbo.tblAnimalCategories
5 WHERE ZooDB.dbo.tblAnimalTypes.Category=
6     ZooDB.dbo.tblAnimalCategories.CategoryID AND
7     ZooDB.dbo.tblAnimalCategories.Category='perch-like';
8
9 -- target: Result
10 SELECT EnglishName, LatinName
11 FROM ZooDB.dbo.tblAnimalTypes
  
```

- Click the **Add Region**  button in the SQL Script toolbar or select the menu option

SQL Editor | Insert Region.

The area that you marked becomes a region and can be expanded or collapsed.

```

1  -- region Perch-like
2  -- target: Result
3  SELECT COUNT
   (ZooDB.dbo.tblAnimalTypes.EnglishName)
4  FROM ZooDB.dbo.tblAnimalTypes,
   ZooDB.dbo.tblAnimalCategories
5  WHERE ZooDB.dbo.tblAnimalTypes.Category=
   ZooDB.dbo.tblAnimalCategories.CategoryID AND
6  ZooDB.dbo.tblAnimalCategories.Category=
   'perch-like';
7  -- endregion
8
9  -- target: Result
10 SELECT EnglishName, LatinName

```

Regions can be collapsed and expanded in order to display or hide parts of SQL scripts. It is also possible to nest regions within other regions.

To collapse or expand a region:

Do one of the following:

- Click the collapse icon for the region.
The region is collapsed and only the `-- region` comment is visible. In the screenshot below, notice how the line numbering at Line 1 has been collapsed together with the collapsed nodes.

```

1  -- region Perch-like
8
9  -- target: Result
10 SELECT EnglishName, LatinName
11 FROM ZooDB.dbo.tblAnimalTypes
12 INNER JOIN ZooDB.dbo.tblAnimalCategories
13 ON ZooDB.dbo.tblAnimalTypes.Category=
   ZooDB.dbo.tblAnimalCategories.CategoryID AND
14 ZooDB.dbo.tblAnimalCategories.Category='perch-like'
15 ORDER BY LatinName ASC;

```

- Click the expand icon for the region.
The text of the region is visible again.

The **Toggle All Folds** command in the SQL Editor toolbar toggles all nodes together to their expanded or collapsed forms.

To collapse or expand all regions:

- Click the **Toggle All Folds**  button in the SQL Editor toolbar.

To remove a region:

- Delete the `-- region` and `-- endregion` comments.

Indentation guides

Indentation guides are vertical dotted lines that indicate the extent of a line's indentation. They

can be toggled on and off in the **Text View Settings** dialog box.

End-of-line markers, whitespace markers

End-of-line (EOL) markers and whitespace markers can be toggled on in the **Text View Settings** dialog box. The screenshot below shows these markers in the document display; each dot represents a whitespace.

```
INSERT·INTO·tblAnimalCategories·(Category)·  
VALUES·('marsupial')·CR  
CR  
DECLARE·@CategoryID·As·int·CR  
CR  
SET·@CategoryID·=·(SELECT·CategoryID·FROM·  
tblAnimalCategories·WHERE·Category·=·
```

Zooming in and out

You can zoom in and out of an SQL Editor window by scrolling (with the scroll-wheel of the mouse) while keeping the **Ctrl** key pressed. This enables you to magnify and reduce the size of text in SQL Editor. If you wish to increase the size of fonts, do this in the [Options](#) dialog box.

11.5 Executing SQL

SQL statements that have been created in the SQL editor or SQL files that have been opened in the SQL Editor can be executed directly from the SQL Editor. The Execute command can be called via the **SQL Editor** menu, via a keyboard shortcut or by clicking a toolbar icon.

To execute SQL in an SQL Editor window:

1. Make the SQL Editor window in which you want to execute SQL the active window.
2. Optionally, select the statement or statements you want to execute, or select a statement using one of the [text selection icons](#) in the toolbar.
3. Click the **Execute**  button, or select the menu option **SQL Editor | Execute**, or press **F5**.

If the data source is not connected, a popup message is displayed asking whether you would like to connect to the data source (provided that the SQL file is not set to Offline).
4. If applicable, click **Yes** in the message box to connect to the data source.

All SQL statements that are in the SQL Editor, or the selected statements, respectively, are executed. The results appear in separate [result windows](#), one for each statement.
5. Click the respective tabs to access the individual results.

Alternatively, you can also execute SQL scripts in the Project window if the SQL files are included in the project.

To execute an SQL file:

1. In the Project window, select an SQL file that you want to execute.
2. Right-click the file and choose **Execute SQL** from the context menu.

If the data source is not connected, a popup message is displayed asking whether you would like to connect to the data source.
3. If applicable, click **Connect** in the message box to connect to the data source.

The SQL script opens in a new SQL Editor window and is executed immediately.

Execute for Data Editing

When supported in the active data source connection, you can also execute a SELECT statement for data editing in the Result window. In this case, the **Execute for Data Editing**  button will be enabled in the toolbar of the SQL Editor and the **Execute for Data Editing** command will be available in the **SQL Editor** menu.

To execute SELECT statements for data editing:

1. Generate a SELECT statement in an SQL Editor window that is connected to a data source that supports data editing from within the SQL Editor.
2. Click the **Execute for Data Editing**  button or select the menu option **SQL Editor | Execute for Data Editing**.

The Result window is switched into the Editing mode and you can [edit the database data](#) directly in the result grid.

Asynchronous execution and retrieval

DatabaseSpy uses asynchronous execution and retrieval when a query is started in the SQL Editor or from within a Design Editor or Data Comparison window. While the execution is in

progress, DatabaseSpy displays a message in the Message window (*see screenshot below*).

So, in large databases you can cancel the execution by clicking the **Stop Execution/Retrieval**  button in the SQL Editor toolbar while the execution is in progress and retrieval has not yet been started. This way, you can abort an execution when you notice that the retrieval would take too much time, and refine the query.

After you have canceled an execution or retrieval, a note is displayed in the status bar of the Result window, and you can edit your query as required and restart the execution.

Defining the execution mode

You can choose whether you want to send the SQL that is contained in the active SQL Editor window to the database engine as a whole, or as separate batches. The Properties window provides the SQL Editor should require semicolons check box and the Group statements for execution with drop-down list in the Options section for this purpose.

The Group statements for execution with drop-down list provides the following options:

- **Semicolons:** The parser uses semicolons as statement separator. Any SQL code that is terminated by a semicolon is considered a statement and sent to the server separately.
- **No Grouping:** The script is sent to the server as a whole, without any modification.
- **SQL Grammar:** The respective flavor of SQL grammar is used to separate the statements when sending them to the server. If the SQL Editor cannot detect any valid SQL statements, a message box is displayed.

If you are sure that the statement is correct, you can click **Yes** and execute the statement as it appears in the SQL Editor. Clicking **No** will abort the execution so that you can correct the statement.

- **GO keyword:** A GO keyword must be present in the SQL script to separate execution blocks.

Showing execution groups

The toolbar in the SQL Editor provides the **Show groupings for execution**  button which allows for a graphical illustration of the statement blocks that will be sent to the database engine

for execution.

```
1  -- target: AnimalTypeCountQuery
2  SELECT COUNT (ZooDB.dbo.tblAnimalTypes.EnglishName)
3  FROM ZooDB.dbo.tblAnimalTypes, ZooDB.dbo.
   tblAnimalCategories
4  WHERE ZooDB.dbo.tblAnimalTypes.Category=ZooDB.dbo.
   tblAnimalCategories.CategoryID AND
5  ZooDB.dbo.tblAnimalCategories.Category='perch-like';
6
7  -- target: AnimalNameQuery
8  SELECT EnglishName, LatinName
9  FROM ZooDB.dbo.tblAnimalTypes
10 INNER JOIN ZooDB.dbo.tblAnimalCategories
11 ON ZooDB.dbo.tblAnimalTypes.Category=ZooDB.dbo.
   tblAnimalCategories.CategoryID AND
12 ZooDB.dbo.tblAnimalCategories.Category='perch-like'
13 ORDER BY LatinName ASC;
```

In the screenshot above, the groupings for execution are displayed when the "Semicolons" option is selected in the Group statements for execution with drop-down list.

Execution timeout

You can define a timeout for the execution of queries in the Retrieval settings group box of the [SQL Editor options](#). DatabaseSpy will stop retrieving data after the specified amount of time has elapsed. However, you can define in the options that a dialog be displayed in this case, allowing you to change the timeout settings in the **Options** dialog box.

If you click the ☐ Don't show this dialog again check box, the dialog will be suppressed in the future. However, the timeout message will nevertheless appear in the Output window and you can re-enable the dialog display at any time in the [SQL Editor options](#).

11.6 Autocompletion

When entering an SQL statement in the SQL Editor, autocompletion helps you by offering lists of appropriate keywords, data types, identifiers, separators, and operators depending on the type of statement you are entering.

On the [autocompletion page](#) of the **Options** dialog box, you can choose whether autocompletion should be triggered (i) manually, by pressing the **Ctrl+Space** keyboard shortcut, or (ii) automatically after a delay time which can be defined.

To automatically trigger autocompletion:

1. Select **Tools | Options...** or press **Ctrl+Alt+O**.
The **Options** dialog box appears.
2. Click Autocompletion.
The settings for autocompletion appear.
3. In the Triggering Autocompletion group box, select the **Automatically open after (delay in milliseconds)** check box.
4. Optionally change the delay time.
5. Click **OK**.

To manually invoke autocompletion:

- In the SQL Editor press **Ctrl+Space** to open the autocompletion window without having to type anything. Please note that this does not necessarily enable autocompletion. If autocompletion is set to **Manually trigger autocompletion using the Ctrl+Space keys** in the autocompletion options, this command just brings up the autocompletion window once.

When autocompletion is invoked by either of these methods, an autocompletion popup appears when you start typing in the SQL Editor.

Text that will be replaced by the selection you make in the autocompletion window is displayed with a yellow background in the SQL Editor. You can resize the window and customize the data it displays. The toolbar at the bottom of the window allows you to [show or hide certain categories](#) of data you want to have proposed for autocompletion. This allows you, for example, to have only keywords, or tables, etc. displayed.

The autocompletion window works dynamically, that is, it starts displaying data as soon as they are loaded and the list is getting more comprehensive as more and more data is being loaded. This way, in large database systems, you do not have to wait until all data is available and can start working with what is currently at hand. When data is still being loaded into the autocompletion window, the respective icon in the toolbar is displayed with a green background. In the screenshot above, the schemas information is still being loaded.

You can configure the autocompletion window by activating or deactivating the required buttons.

The entries displayed in the autocompletion window can be sorted in ascending or descending order by clicking the respective column title bar.

Configuring the Autocompletion window

You can limit the auto-completion entries according to the position within the SQL statement that is currently being typed by enabling the **Context-Sensitive Suggestion**  button in the autocompletion toolbar. DatabaseSpy's parser tries to suggest only entries that fit into the statement at the current location. If you deactivate this option, all available entries are listed in the autocompletion window.

When single mode is active, only a single category of entries is displayed in the autocompletion window. The category that has been selected last is activated upon toggling the **Single Mode**  button on in the autocompletion toolbar. You can then choose any desired category by clicking the corresponding toolbar icon in the autocompletion window.

Activating the **Select All Categories**  icon shows entries of all categories in the autocompletion window. The **Clear All Categories**  icon clears all categories with a single mouse click and allows you to select the required categories afterwards.

To configure the autocompletion window:

In the autocompletion toolbar, do one of the following:

- Activate the **Context Sensitive Suggestion**  button if you want to display only entries that may be suitable in the current context of the SQL statement.
- Activate the **Select All Categories**  or **Clear All Categories**  button, respectively.
- Restrict the display in the autocompletion window to certain categories by deactivating the buttons for the unwanted entries.
- Switch to single mode by activating the **Single Mode**  button. Only one category can be selected in this case.
- Display the full path for schemas, tables, views, columns, and procedures by clicking the **Show Paths**  button or pressing the **Alt** key.

Inserting paths

You can either insert only the name of a database object, or its entire path into the SQL Editor window when using autocompletion. By default, only the name of a database object appears in the autocompletion window. The **Show Paths**  button allows you to display the path of the object. Alternatively, you can also press the **Alt** key to toggle the **Show Paths** button on and off.

In the autocompletion window, you can display paths of schemas, tables, views, columns, and procedures. When the **Show Paths**  button is toggled on, the path as displayed in the autocompletion window is inserted into the SQL Editor window.

Selecting categories

Unless you have selected single mode, you can choose one or several categories of entries to be displayed in the autocompletion window. The following options are available in the autocompletion toolbar:

Schemas: Displays database schemas in the autocompletion window. Note that you can choose whether you insert only the schema name or the entire path to the schema.

Tables: Displays tables in the auto-complete window. You can choose to insert name or path of a table.

Views: Displays views in the auto-complete window. You can choose to insert name or path of a view.

Columns: Displays table columns in the auto-complete window. You can choose to insert name or path of a column.

Functions: Displays functions such as ABS, COUNT, ROUND, etc. in the autocompletion window.

Data type: Displays the available data types for table columns in the autocompletion window.

Procedures: Displays stored procedures in the auto-complete window. You can choose to insert name or path of a procedure.

Keywords: Displays keywords such as SELECT, INSERT, UPDATE, etc. in the autocompletion window.

Separators: Displays separators such as ";", "(", ")", etc. in the autocompletion window.

11.7 Commenting Out Text

In the SQL Editor it is possible to comment out statements, parts of statements, or groups of statements. These statements, or the respective parts of them, will be skipped when the SQL script is being executed.

To comment out a section of text:

1. Select a statement or part of a statement.

```
-- target: AnimalNameQuery
SELECT EnglishName, LatinName
FROM ZooDB.qa_usr.tblAnimalTypes
INNER JOIN ZooDB.dbo.tblAnimalCategories
ON ZooDB.qa_usr.tblAnimalTypes.Category=ZooDB.dbo.tblAnimal
AND
ZooDB.dbo.tblAnimalCategories.Category='perch-like'
ORDER BY LatinName ASC
```

2. Click the **Comment/Uncomment selected block**  button in the SQL Script toolbar or select **Insert | Insert/Remove Block Comment** from the **SQL Editor** menu. The statement is commented out.

```
-- target: AnimalNameQuery
SELECT EnglishName, LatinName
FROM ZooDB.qa_usr.tblAnimalTypes
INNER JOIN ZooDB.dbo.tblAnimalCategories
ON ZooDB.qa_usr.tblAnimalTypes.Category=ZooDB.dbo.tblAnimal
/*AND
ZooDB.dbo.tblAnimalCategories.Category='perch-like'*/
ORDER BY LatinName ASC
```

To comment out text line by line:

1. Put the cursor in a statement at the point from which you want to comment it out.

```
-- target: AnimalNameQuery
SELECT EnglishName, LatinName
FROM ZooDB.qa_usr.tblAnimalTypes
INNER JOIN ZooDB.dbo.tblAnimalCategories
ON ZooDB.qa_usr.tblAnimalTypes.Category=ZooDB.dbo.tblAnimal
AND
ZooDB.dbo.tblAnimalCategories.Category='perch-like'
ORDER BY LatinName ASC
```

2. Click the **Comment/Uncomment selected lines**  button in the SQL Script toolbar or select **Insert | Insert/Remove Line Comment** from the **SQL Editor** menu. The statement is commented out from the current position of the cursor to the end of the line.

```
-- target: AnimalNameQuery
SELECT EnglishName, LatinName
FROM ZooDB.qa_usr.tblAnimalTypes
INNER JOIN ZooDB.dbo.tblAnimalCategories
ON ZooDB.qa_usr.tblAnimalTypes.Category=ZooDB.dbo.tblAnimalC
AND
ZooDB.dbo.tblAnimalCategories.Category='perch-like'
--ORDER BY LatinName ASC
```

To remove a block comment or a line comment:

1. Select the part of the statement that is commented out.
If you want to remove a line comment, it is sufficient to select only the comment marks
-- before the comment.
2. Do one of the following:
 - Click the **Comment/Uncomment selected block**  button in the SQL Script toolbar or select **Insert | Insert/Remove Block Comment** from the **SQL Editor** menu.
 - Click the **Comment/Uncomment selected lines**  button in the SQL Script toolbar or select **Insert | Insert/Remove Line Comment** from the **SQL Editor** menu.

11.8 Naming Result Tabs

When you execute a script that contains more than one SELECT query, the results of each query are displayed in separate result windows. By default, these windows are called "Result1", "Result2", etc. Using **targets**, you can specify more meaningful names for query result windows.

Please note: Currently, the target keywords are only recognized if in the Properties window of the active SQL Editor either "Semicolons" or "SQL Grammar" is selected in the **Group statements for execution with drop-down list**. If you execute a query containing target keywords without having selected the appropriate options, the query is still executed, but output to unnamed result tabs. A warning is displayed in the Message tab of the Result window.

To name a target result window:

1. Place the cursor anywhere in the SELECT statement. Click the **Current statement**  button (**Shift+Alt+Enter**) in the SQL Editor window. This selects the entire statement.
2. Click the **Define Target Name**  button in the SQL Script toolbar. The text `-- target: Result` appears above the statement.

```
-- target: Result
SELECT [ZookID], [FirstName], [LastName], [Address],
[City], [State], [Telephone], [DOB] FROM
[ZooDB].[dbo].[tblZookeepers];
```

3. Change the text "Result" as desired.

```
-- target: zookeepers
SELECT [ZookID], [FirstName], [LastName], [Address],
[City], [State], [Telephone], [DOB] FROM
[ZooDB].[dbo].[tblZookeepers];
```

4. In the Properties window, make sure that either "Semicolons" or "SQL Grammar" is selected in the **Group statements for execution with drop-down list**.
5. Click the **Execute**  button or press **F5**. The results appear in a Result window that has a tab with the text that you specified as target, e.g., zookeepers.

```
1  -- target: zookeepers
2  SELECT [ZookID],[FirstName],[LastName],
        [Address],[City],[State],[Telephone],[DOB]
   FROM [ZooDB].[dbo].[tblZookeepers];
```

zookeepers

	ZookID	FirstName	LastName	Address	City	State
1	1	Annette	Bearhug	451 Capybara Lane	Newark	NJ
2	2	Bob	Barker	68 Cage Boulevard	Philadelphia	PA
3	3	Oliver	Birdsong	987 Flamingo Avenue	Harrisburg	PA
4	4	Jenny	Lionheart	276 Cheetah Street	Sayre	PA

Execution was successful. Rows: 15, Cols: 8 0.250 sec 10:47:39

Message zookeepers

11.9 Finding and Replacing Text

The standard Windows **Find** and **Find & Replace** dialog boxes are available in the SQL Editor. The text you enter into the `Find what` field is searched always in the active SQL Editor window.

To search for text in the active SQL Editor window:

1. Select the menu option **Edit | Find** or press **Ctrl+F**.
2. Enter the text you want to search for into the `Find what` field.
3. Do one of the following:
 - Click **Find Next**. Optionally, click the **Find Previous** button to jump back to the previous occurrence of the search text.
 - Click **Mark All** and use the **Next Bookmark**  and **Previous Bookmark**  icons in the SQL Editor toolbar to navigate between the occurrences of the search text.

To search and replace text:

1. Select the menu option **Edit | Replace** or press **Ctrl+R**.
2. Enter the text you want to search for in the `Find what` field.

3. Enter the text you want to replace found text with in the `Replace with` field.
4. Click **Find Next** to find the text.
5. When the text is found, click **Replace** if you want to replace it with the new text.

Options

You can check one or more of the options in the Options group box to select them.

`Match whole word only` finds the text string only if, in the document, it is delimited by spaces. `Match case` finds the text string only if the casing in the document is the same as that in the entry.

Checking the `Regular expression` option causes the entry to be read as a regular expression. The  button to the right of the `Find what` combo box opens a menu with entries to help define regular expressions. A pop-up list is available to help you build regular expressions. To access this list, click the  button to the right of the input field for the search term.

When you select an entry in the regular expressions popup, DatabaseSpy inserts the corresponding regular expression in the `Find what` field.

- **Any Character** inserts ".". To find "Smith" as well as "Smyth", enter the following:

`Sm.th`

- **Character in Range** inserts "[]". Note that the cursor appears between the two brackets. To find "Wong" and "Wang", but not "Wing", enter the following:

`W[ao]ng`

- **Character Not in Range** inserts "[^]" and places the cursor after the ^-sign. Enter the character you want to disregard when searching. Note that you can also enter several characters.

`W[^a]ng`

- **Beginning of Word** inserts "\<". First choose the regular expression from the popup and then enter the string you want to find. "\<mark" will find "marketing" but not "benchmark".

`\<mark`

- **End of Word** inserts "\>". First enter the string you want to find and then choose the regular expression from the popup. "mark\>" will find "benchmark" but not "marketing".

`mark\>`

- **Beginning of Line** inserts "^". DatabaseSpy will find the string that follows only if it appears at the beginning of a line.

`^Altova`

- **End of Line** inserts "\$". Enter a string and choose "End of Line" from the popup. DatabaseSpy will find the string only if it appears at the end of a line.

Altova\$

- **Tagged Expression** inserts "\(\)" and places the cursor in front of the second backslash so that you can enter the tagged expression.
- **0 or More Matches** inserts "*". The character or set of characters, respectively, preceding the * can optionally occur in the string to be found.
- **1 or More Matches** inserts "+". The character or set of characters, respectively, preceding the + can occur once or several times in the string to be found.

11.10 Selecting Data for Export

In addition to DatabaseSpy's powerful [export function](#), you can use SELECT statements to retrieve data from a table and export only this particular data to a range of file formats such as

XML or HTML. The SQL Editor window provides an additional **Export**  button to open the **Export database data** dialog box to facilitate this. When you click this button, the dialog box opens with the **SQL** radio button activated and the content of the SQL Editor window inserted into the Source group box.

Please note: Clicking the **Export**  button in the Tools toolbar will also open the **Export**

database data dialog box. However, in this case the **Table** radio button will be preselected and you would have to type in or paste the SQL code manually.

To export data using SQL statements in an SQL Editor window:

1. Make the SQL Editor window whose SQL statements you want to use for export the active window.
2. Press the **Export**  button in the SQL Editor window. The **Export database data** dialog box opens. The SQL statements that are currently in the SQL Editor appear in the Source group box.
3. Optionally, enter a file prefix that will be added to the file name.
4. Do one of the following:
 - Activate the **Path** radio button and enter the Path you want the destination files to appear in.
 - Activate the **Export to XMLSpy** radio button if you want your exported data to be displayed in XMLSpy.
Note that this option is not available for export to Excel files.
5. Optionally click the Options tab to change the options for [XML](#), [XML Structure](#), [CSV](#), [HTML](#), or [Excel](#).
6. Click the **Export** button when all the settings are correct.
A message box appears to inform you about the success of the export.
7. Click **OK**.
The data is exported as Table1 in the desired format and either stored under the path you specified or opened in XMLSpy for further editing.

11.11 Toolbar Options

When working with SQL in the SQL Editor, two toolbars are available that affect the appearance of SQL Editor windows and their contents:

- **SQL Editor:** The buttons in this toolbar correspond to the commands in the [SQL Editor](#) menu.

- **SQL Script:** This toolbar includes buttons for the options contained in the [Insert](#) sub-menu of the **SQL Editor** menu.

Click the toolbar icons in the illustrations above to view a description of the individual buttons.

The **Toggle All Folds** command opens or closes all [regions](#) in the SQL script depending on whether the individual region is open or closed at the time.

11.12 Printing SQL

You can print the content of the SQL Editor like in any other text editor. When turning on the line numbers margin, you can also print out line numbers.

Please note: The source folding margin and the bookmarks margin have no effect on the print-out. Neither the expand/collapse icons nor the bookmarks will show up in the print-out.

A print preview is available for you to check the layout of the printed page before sending it to the printer.

To print the content of an SQL Editor window:

1. Click in the SQL Editor window to make it active.
2. Select the menu option **File | Print...**, or press **Ctrl+P**, or click the **Print**  icon in the Standard toolbar.
3. In the Print range group box, define whether you want to print all or specific pages or only the selected part of the SQL.
4. Optionally, define the printer setup by clicking the **Properties** button.
5. Click **OK**.

To preview SQL before printing:

1. Click in the SQL Editor window to make it active.
2. Select the menu option **File | Print Preview**.
3. In the print preview do one of the following:
 - Click the **Print** button to print the file.
 - Click **Close** to return to the SQL Editor.

Chapter 12

Comparing Database Data

12 Comparing Database Data

Altova web site:  [compare database contents](http://www.altova.com/compare-database-contents)

To compare database data in DatabaseSpy, the tables that should be compared are [added to components](#) in a Data Comparison window, where they are [mapped](#), and where several options for [comparing](#) and [merging](#) the table data are provided. The two components represent the databases that are compared and are indicated with different colors (grey: left component, dark yellow: right component). These colors will later also appear in the [Comparison Result window](#) so that you can easily see which column belongs to which database. The title bar of each component displays the name of the database; if you place the mouse cursor over a title bar, a balloon help appears and displays also the name of the data source that is used to connect to the database.

When the [requirements](#) for a database data comparison are met, there are several ways to start a comparison of databases in DatabaseSpy:

- [Opening](#) a Data Comparison window and adding tables using the **Select Database Objects for Comparison** dialog box. Tables from both databases can be selected in the dialog box.
- Choosing the command **Comparison | Show in new Data Comparison Document** from the context menu that opens when you right-click tables in the Online Browser. The tables from the second database can be added via the **Select Database Objects for Comparison** dialog box or by dragging them from the Online Browser into the right component in the Data Comparison window.
- Opening a data comparison that is included in your DatabaseSpy Project from the Project window.
- Opening a data comparison file that is stored in your file system using the **File | Open | Open File...** command.

You can switch on the display of the Message window by activating the **Toggle Message**

Window  button in the toolbar of the Data Comparison window. The Message window provides a summary of the compared tables and you can click the hyperlinks to jump to the respective table in the Data Comparison window and show its properties in the Properties window (see *screenshot below*).

After [a comparison has been started](#), the Message window shows an overview of the comparison results and provides links to the Comparison Result windows of the individual compared tables (see screenshot below).

12.1 Prerequisites

There are two prerequisites that are mandatory in order to start a table comparison in DatabaseSpy:

- An active [connection to a data source](#)
- A [sorting key](#) in every table that is to be compared

Data source connection

At least one connection to a data source must be available in your DatabaseSpy Project. If this is not the case, an information box is displayed which allows you to add a data source.

Clicking **Yes** in this dialog box takes you directly to the **Create a Database Connection** dialog box where you can [define a data source connection](#). The new data source is then added to the project, DatabaseSpy connects to it, and the **Select Database Objects for Comparison** dialog box opens.

If none of your project's data sources are connected when you select the **File | New | Data Comparison** menu option, you also cannot start a data comparison.

Close the message box by clicking **OK** and connect to one of the data sources that are available in your project.

Key column

At least one column in each table is used as a sort criterion that is needed for comparison. DatabaseSpy uses primary key columns to sort tables for comparison. DatabaseSpy indicates tables that cannot be compared (see *screenshot below*), and these tables cannot be mapped.

12.2 Opening a Database Data Comparison Window

When opening a new Data Comparison window, the database comparison is given a name of the form `DatabaseDataComparisonX`, where `X` is an integer indicating that database comparison's position in the sequence of database comparisons opened in the current DatabaseSpy session. This name appears in a tab at the bottom of the window.

The **File | New | Data Comparison** command opens the Data Comparison window and pops up the **Select Database Objects for Comparison** dialog box, where you must connect to the databases you want to compare (one in each component) and [select](#) the required tables. Usually you will also [select](#) the first database when opening a new Data Comparison window. However, you could also just open a Data Comparison window and [add](#) the tables later. This way, you could, for example, create comparison templates with different options (e.g., ignore whitespace or case, etc.) and save them in a project.

To open a Data Comparison window:

- Select the menu option **File | New | Data Comparison** or click the **Data Comparison**  button in the Standard toolbar (Make sure that you are connected to a data source). If the `Show table selection for new documents` check box on the Data Compare page of the **Options** dialog box is activated (default setting), the **Select Database Objects for Comparison** dialog box pops up automatically.
If you just want to open a Data Comparison window without selecting a database yet, click **Cancel**. The **Select Database Objects for Comparison** dialog box closes and the empty Data Comparison window is displayed in DatabaseSpy.

12.3 Selecting Tables

Tables are selected for comparison (i) in the **Select Database Objects for Comparison** dialog box or (ii) directly in the Online Browser using a context menu command. For both options an active connection to a data source is mandatory, and both options will automatically open a Data Comparison window.

Selecting tables using a selection dialog box

If you start a new database data comparison in DatabaseSpy and want to choose the tables from both databases in a single step, this will be your preferred method. The **Select Database Objects for Comparison** dialog box can be called in various ways:

- Selecting the menu option **File | New | Data Comparison** or clicking the **Data Comparison**  button in the Standard toolbar opens a new Data Comparison window and brings up the dialog box.
- If a Data Comparison window is already open, you can either click the **Browse** button in the title bar of either component or double-click one of the title bars. The **Select Database Objects for Comparison** dialog box opens with the pane for the left or right component, respectively, selected.

In the **Select Database Objects for Comparison** dialog box, the first connected data source is suggested in the **Data Source** drop-down list. However, all data source connections of the project can be selected in the **Data Source** drop-down list of the dialog box, no matter whether they are currently connected or not. If you choose an unconnected data source, DatabaseSpy automatically establishes a connection.

If the data source containing the tables you want to compare is not included in your project and is therefore not listed in the drop-down list, you can click the **Browse** button in the Data Source group box to open the **Create a Database Connection** dialog box, where you can create the

required data source connection. Note that any data source connection created from within the **Select Database Objects for Comparison** dialog box will be automatically added to your DatabaseSpy Project!

To add tables to a comparison component via selection dialog box:

1. Make sure that a connection to a data source exists in your DatabaseSpy Project.
2. Do one of the following:
 - If you want to open a new Database Comparison window, select the menu option **File | New | Data Comparison** or click the **Data Comparison**  button in the Standard toolbar. The **Select Database Objects for Comparison** dialog box opens with the **Left Side** button activated.
 - If a Database Comparison window is already open, click the Browse button in the title bar, or double-click the title bar of either component.

The **Select Database Objects for Comparison** dialog box opens with either the **Left Side** or the **Right Side** button activated, depending on the component you have used to call the dialog box.

3. Choose one of your project's data sources from the **Data Source** drop-down list.
4. Expand the data source as required and choose the desired tables by activating the respective check boxes. Activating a folder check box selects all the tables that are contained in the folder.
5. Click the **Right Side** button (or the **Left Side** button, respectively, if you started from the right side) and repeat steps 3 and 4 for the second database.
6. Click **OK**. The selected tables are displayed in the components of the database comparison window.

Selecting tables using the Online Browser

If both data sources are connected and the tables to be compared are therefore displayed in the Online Browser you can use (i) the context menu or (ii) drag and drop to select tables for, or add tables to, a comparison.

To use the Online Browser to add tables to a comparison component:

1. Select the tables that you want to add to a comparison component in the Online Browser.
2. Right-click and do one of the following:
 - If you want to open a new Database Comparison window, select **Comparison | Show in new Data Comparison Document** from the context menu. A new Database Comparison window opens and the selected tables are added to the left comparison component.
 - If you want to add tables to an existing Database Comparison window, select **Comparison | Add to Data Comparison Document** from the context menu. The tables are added to the component that contains the respective data source or, if the data source is not yet present in the comparison, to the empty component.
3. Alternatively, if a Database Comparison window is already open, drag and drop tables from the Online Browser to the desired component in the Database Comparison window.

4. Repeat step 2 or 3 for the second database.

12.4 Adding and Removing Tables

If you need to add one or more tables to a database data comparison, you can use the **Select Tables for Comparison** dialog box, the context menu in the Online Browser, or drag-and-drop to do so.

To add tables to an existing data comparison:

- In the Data Comparison window, click the **Browse** button in either component or double-click the title bar of a component to open the **Select Database Objects for Comparison** dialog box. If you have clicked into the left component, the dialog box opens for the left side of the comparison, ditto for the right side.
- Select the tables in the Online Browser, right-click and choose **Comparison | Add to Data Comparison Document** from the context menu. The tables will be added to the component that contains the corresponding data source.
- Select the tables in the Online Browser and drag them to a component that contains the corresponding data source. Note that tables cannot be dragged onto components that contain a data source that does not match the selected tables' data source.

Removing tables from a component

A table is removed from a comparison component when you deselect its check box in the **Select Database Objects for Comparison** dialog box.

To remove a table from a component:

- Open the **Select Database Objects for Comparison** dialog box and deselect the table in the Source group box.

12.5 Mapping Tables and Columns

After you have selected two tables for comparison, DatabaseSpy analyzes the structure of the tables and presents them in the Data Comparison window.

Mapping options

The default comparison options define that tables and columns be mapped automatically according to the table name or column name, respectively, after the second database has been selected. You can change these options on the [Data Compare](#) page of DatabaseSpy's **Options** dialog box.

If you do not change these settings, all tables and columns that you [include in a component](#) for comparison will be mapped automatically. Mapped tables are connected by bold black lines. You can expand or collapse tables to view or hide the table columns. Mapped columns are connected by blue lines.

You can disable auto-mapping for the active comparison and for future comparisons by deactivating the `Map tables automatically` check box on the [Data Compare](#) page of the **Options** dialog page. When auto-mapping is disabled, you can map columns and/or table in several ways:

- Select the **Map items** option from the context menu
- Draw a mapping line between the two components

To map tables or columns manually:

1. In a Data Comparison window, click the triangle next to a table name and, keeping the mouse button pressed, move the cursor to the corresponding triangle in the second component. Now triangles are also displayed for the columns of the connected table.

- Repeat step 1 for all columns that you want to include in your comparison. Be sure to map the column which is indicated by a cyan triangle since this column is used as a sort criterion and the tables cannot be compared without it.

To map all tables of a component:

- Right-click the title bar of either the left or the right component and select **Map items** from the context menu.

12.5.1 Mapping Columns

When columns are mapped automatically, you can choose from among the following options on the Data Compare page of the **Options** dialog box:

- Column name:** DatabaseSpy checks for matching column names in both tables. Additional options for ignoring case sensitivity or white space are also available on the Comparison Options page of the **Options** dialog box (for all future comparisons) or the Properties window of the active Data Comparison window (for the current comparison), respectively.
- Data type:** This option should only be used in small databases where each column has a unique data type to prevent conflicts with multiple columns of the same data type. DatabaseSpy analyzes the tables' data types and assigns them to a set of data type representations which can be compared. This way you could automatically map columns that have a different name but share the same data type.
- Name and data type:** Using this option, DatabaseSpy considers first the column name and then its data type when mapping.
- Ordinal position:** Columns will only be mapped if the ordinal position at the time of table creation is identical in both tables. This way you can compare tables that are equally designed but use different column names.

Manual mapping

If automatic mapping fails for some reason (e.g., because of a typo in a column name), you can map columns manually by drawing a line between the triangles next to the column names in both components.

In the screenshot below, the "Introduced" column could not be mapped automatically because it is misspelled in the right component. You have to map this column manually.

Note that you can only map two columns when their parent tables are also mapped. A mapping as illustrated in the screenshot below is not allowed and hence impossible.

To map columns manually:

1. Click the triangle next to the column name in the first component and, keeping the mouse button pressed, move the cursor to the corresponding triangle in the second component.
2. When the shape of the cursor changes (*see first screenshot above*) release the mouse button. The dotted connection line becomes solid and the two columns are mapped. You can only map columns when the corresponding tables have already been mapped (*see second screenshot above*).

12.5.2 Changing and Deleting Mappings

Mappings that are incorrect or concern columns that should not be compared can be deleted. You can also change the mapping of a table or column and map it to a different table or column in the second comparison component.

DatabaseSpy provides context options for deleting the mapping of the selected object or all objects of the comparison component. In addition, you can use your mouse to change the mapping of individual tables or columns. Note that if you have activated automatic mapping of columns in the Data Compare options, DatabaseSpy tries to map columns automatically when you change the mapping of a table.

To delete mappings:

Do one of the following:

- To delete all mappings of a comparison, right-click the title bar of either component and choose **Unmap items** from the context menu.
- To delete a single table or column mapping, right-click the appropriate object and choose **Unmap selected** from the context menu.
- Click the connection line between two mapped tables or columns and hit the **Del** button.

Note that unmapping a table will also unmap all columns of that table.

Changing the mapping

If you want to change an existing mapping, you can either delete the incorrect mapping and use one of the methods for [manual mapping](#) or simply re-draw the connection line between two tables. Please note that you cannot change the end point of a connection line but have to create a mapping as if no mapping would exist for the table or column in question.

In the example above, the Opening column in the right component has been incorrectly mapped to the OpenedBy column in the left component. To correct this, start at the triangle next to the Opening column on the right side and draw a connection to the OpeningCeremony column on

the left side. You could also start at the OpeningCeremony column and connect it with the Opening column. The incorrect mapping between OpenedBy and Opening will disappear when the mouse button is released.

To change an incorrect mapping:

- Ignore the existing mapping and [draw a connection](#) between the two tables or columns you want to map.

12.5.3 Sorting Mapped Tables

Tables that are displayed in the components of a Data Comparison window can be sorted either ascending or descending. In addition, DatabaseSpy provides the option to prefer mapped tables in the sort order so that all mapped tables are sorted either ascending or descending, and only then the remaining, unmapped tables are displayed in a component.

The tables in the screenshot below have been sorted using the command **Ascending mapped first**. Note that the column order cannot be changed, only the tables are sorted with the mapped tables being displayed on top.

The sort options are available in the **Data Comparison** menu and in the context menu that appears when you right click the title bar of either component or an unoccupied area of the Data Comparison window. Please note, that the sorting commands always apply to both databases, irrespective of which title bar you have clicked.

To sort tables in the Data Comparison window:

1. Do one of the following:
 - Select the menu option **Data Comparison**.
 - Right-click the title bar of either the left or the right component.
 - Right-click into an unoccupied area of the Comparison window.
2. Choose either **Ascending** or **Descending** from the **Sort tables** sub-menu. If you want to exclude unmapped tables from the sort order, choose **Ascending mapped first** or **Descending mapped first**, respectively.

Dragging tables in components

You can always change the position of a table within a comparison component by dragging the table to the desired location. If both components are connected to the same data source, you can also drag a table from one component to the other. The order in which the columns of a table appear in a component is determined by the column's ordinal position and cannot be

changed.

12.6 Modifying the Database Comparison Options

The default comparison options are defined on the [Comparison Options](#) and [XML Compare](#) pages of the **Options** dialog box. These settings apply to all Data Comparison windows that are opened in the future. In the Properties window, you can customize these settings for the current comparison. Any changes you make in the Properties window apply only to the active data comparison and are saved together with the comparison structure in the `*-.dbdif` file.

To modify the database comparison options:

1. Click into an unoccupied area of the active Data Comparison window or click its tab.
2. Change the comparison options as required in the Properties window.
3. Optionally, save the data comparison file (`*.dbdif`).

12.6.1 Options for String Comparison

The Comparison Options page of the **Options** dialog box displays the default comparison options for all future Data Comparison windows. Special comparison options for XML fields are defined on the [XML Compare](#) page.

Comparison Options Reset to Page Defaults

When creating a new document, options on this page are used as initial values.

Comparison Mode

☒ Use native type for comparison ☐ Use string-representation for comparison

Comparison Options

☒ Ignore case in comparison
☐ Ignore whitespaces in comparison
☐ Treat [NULL] as empty string

Numeric Options

☐ Append trailing zeros to floating point numbers

Optimization Options

☐ Keep only different rows in memory

Execution Options

☐ Process comparison sequentially ☒ Use transaction when committing
☒ Process comparison in parallel ☒ Rollback on errors

Comparison Mode

You can choose from among two comparison modes: The native type considers the data type of the column that is compared, whereas everything will be converted into strings before comparison if you use the string representation type.

Comparison Options

Deactivate the `Ignore case in comparison` check box if upper and lower casing should not be ignored when checking for differences.

Check the `Ignore whitespaces in comparison` option if you do not want to consider whitespaces when comparing database data. Whitespace characters are space, tab, carriage return, and line feed.

If you do not want to make a difference between an empty field and a field containing the NULL value, activate the `Treat [NULL] as empty string` check box.

Numeric Options

Floating point numbers can be filled up with trailing zeros by activating the `Append trailing zeros to floating point numbers` check box.

Optimization Options

If you do not care to see rows that are equal in both tables of a comparison, you can check the `Keep only different rows in memory` option. In this case, only different rows are kept in the memory and displayed in the Result window.

Execution Options

You can define whether you want to process comparisons of multiple tables sequentially or in parallel. Changes can be committed with or without the use of transactions and you can decide whether or not you want to rollback on errors.

Comparison Options in the Properties Window

All options described above are also available in the Properties window, if you click the tab of a Data Comparison window. Changes that you make in the Properties window apply only to the active Data Comparison window and are saved together with the data comparison file (*.dbdif).

12.6.2 Options for Comparing XML Fields

The XML Compare page of the **Options** dialog box displays the default comparison options that apply to columns of type XML if native comparison has been selected. The options that are defined on this dialog page are valid for all future Data Comparison windows.

Whitespaces

Whitespace characters are space, tab, carriage return, and line feed. The three options here compare files with whitespace unchanged; with whitespace normalized (i.e., all consecutive whitespace characters are reduced to one whitespace character); and with all whitespace stripped (i.e., not considered for comparison).

Case sensitivity

If the `Ignore case` check box is checked, then case is ignored, and you have the option of ignoring or not ignoring case in node names.

Namespace/Prefix

These are options for ignoring namespaces and prefixes when searching for differences.

Order

If `Ignore order of child nodes` is selected, then the relative position of the child nodes of an element is ignored. As long as an element node with the same name exists in each of the two sets of sibling nodes, the two sets are considered to be equal. Note, however, that if an element node has an attribute, it will always be considered unequal to an element with the same name in the compared sibling set—even if the `Ignore order of child nodes` is selected.

The option of ignoring the order of attributes is also available, and applies to the order of attributes of a single element.

Entities

If `Resolve entities` is selected, then all entities in the document are resolved. Otherwise the files are compared with the entities as is.

Text

If `Ignore text` is selected, then differences in corresponding text nodes are not reported. A different string inside a tag will be ignored since only the XML structure is compared but not the text content of the tags.

Depth

If `Ignore node depth` is selected, then the additional depth of any element (i.e., more levels of descendants) relative to the depth of the corresponding element in the compared file is

ignored.

Ignore node types

Check the node types that will **not** be compared in the Compare session. Node types that may be ignored are Attributes, CDATA, Comments, Processing Instructions, DOCTYPE statements, and XML declarations.

XML Comparison Options in the Properties Window

To display the comparison options for XML, you have to activate the `Use native comparison for XML columns` check box, which is only available if you choose "Native" from the `Compare` drop-down list in the Compare section.

12.7 Saving Database Data Comparison Files

After you have [selected](#) and [mapped](#) tables for comparison and defined the appropriate [comparison options](#), you can save the comparison in a data comparison file that can be added to a project. This is either done via the **File | Save As...** command or by right-clicking the tab of a Data Comparison window and choosing the **Save...** options from the context menu. If you do a particular comparison on a regular basis, the use of a data comparison file which can be opened directly and establishes the needed data source connections automatically may save you a considerable amount of working time.

12.8 Running a Database Data Comparison

After you have [selected](#) and [mapped](#) the tables and columns you want to compare, you can start a database data comparison in DatabaseSpy. Either one or more selected tables or all tables included in the active database data comparison can be compared. A comparison can be started (i) via the **Data Comparison** menu, (ii) the **Start Comparison**  button in the Data Comparison window, or (iii) the context menu. A comparison starts automatically when a *.dbdif document is opened in DatabaseSpy and the `Start comparison when opening a document` check box is activated in the properties of a data comparison file. In the background, SQL SELECT statements are generated and executed for, and data is retrieved from, both tables.

To run a database data comparison:

- To compare all tables in the comparison component, do one of the following:
 - Select the menu option **Data Comparison | Compare tables**.
 - Click the **Start Comparison**  button in the toolbar of the active comparison window.
 - Right-click the title bar of either component and select **Compare items** from the context menu.
 - Press **F5**.
- To restrict comparison to only some of the tables in the component:
 1. Select one or more tables in either component.
 2. Right-click and choose **Compare selected** from the context menu or press **F5**.
- To start a comparison automatically when a *.dbdif file is opened:
 1. Save the database data comparison in to a *.dbdif file.
 2. Activate the `Start comparison when opening a document` check box in the Properties window.

The result of a comparison is indicated with icons in the Data Comparison window. When placing the mouse cursor over an icon, a balloon help appears with a brief description of the comparison result for the selected table (see *screenshot above*). It makes no difference whether you hover over the left or over the right icon. In huge tables which contain a lot of columns, you can collapse and expand individual tables when you are examining the differences. If you double-click a column in one component, both versions of the column are collapsed or expanded, respectively, simultaneously in both components. To collapse all columns in both components with a single click, use the **Collapse tables** command from the **Data Comparison** menu or the context menu that opens when you right click the title bar of a component. Furthermore, the result is displayed in the Message window that automatically

opens after the comparison is completed. You can expand the messages to display more detailed information.

The underlined parts of the messages are hyperlinks. By clicking the links, you can jump either to the individual tables in the left or right component, or open the result view for the individual comparisons. Clicking the [Show all results](#) hyperlink at the bottom of the Message window will open individual result views for all tables that are included in the comparison.

If you place the mouse cursor over one of the table names, a balloon help appears and indicates whether the tables constitutes the left or the right side of the comparison.

12.9 Displaying Differences in Databases

The result of a database comparison is displayed as an overview immediately in the Message window, and in a [balloon help](#) when you hover over one of the comparison icons. A detailed view of the differences is available in the Result window where you can check every table cell for differences.

	Olympiad	Olympiad	Year	Year	HostCity	HostCity	Country	Country
1	I	I	1896	1896	1	1	Greece	Greece
2	II	II	1900	1900	2	2	France	France
3	III	III	1904	1904	3	3	United States	USA
4	IV	IV	1908	1908	4	4	United Kingdom	UK
5	IX	IX	1928	1928	8	8	Netherlands	Netherlands

The Result window for comparisons is a variation of the normal Result window where the columns of the compared tables are displayed next to each other in the result grid. This way, you see the content of the compared columns side by side. Differences are indicated with colors.

Hiding columns without differences

In tables with a large amount of columns where only some of the columns contain differences, you can hide the columns that contain no differences and show only different columns in the result grid. Click the **Show/Hide columns which don't have any differences**  button for this purpose.

Searching text

If you search for a particular string in the Comparison Result window, you can use the **Find**  button in the toolbar.

Displaying large data cells

If the Data Inspector window is not visible in DatabaseSpy, you can click the **Show the Data Inspector window**  button in the toolbar. This pops up the Data Inspector which displays the content of the currently selected cell.

Maximizing the view

The **Maximize the result view**  button allows you to maximize the size of the result grid so as to show as many rows of the comparison as possible. If you then would like to check the mapping once again, you can click the **Go to table mapping**  button.

To show the results of a table comparison:

1. Run a [table comparison](#).
2. Do one of the following:
 - In the Data Comparison window, click one of the comparison result icons  for the compared table.

- In the Message window, click  [Show result window](#).
 - In one of the comparison components, right-click a table and choose **Show selected results** from the context menu.
 - In the Data Comparison window, click the **Show result**  button in the toolbar.
 - Right-click the title bar of a comparison component and choose **Show results** from the context menu.
 - Select the menu option **Data Comparison | Show results**.
3. Optionally, if you want to hide columns where no differences occur, click the **Show/Hide columns which don't have any differences**  button.

12.9.1 Configuring the Comparison Result View

On the Result View page of the **Options** dialog box, you can customize the appearance of the Result View.

Display Options

You can show horizontal and/or vertical lines as well as line numbers in the result grid by activating the respective check boxes. The default gutter width (i.e., the space between the individual column pairs) can also be defined on this page.

Controlling what rows are displayed

You can configure the view of individual Comparison Result windows to display rows on the basis of their compared status. For example, you can opt to not display all equal rows, or to display rows that exist only in the left component but to not display files that exist only in the right component. To do this, you use a set of simple toggle commands that are available as toolbar icons.

Show/Hide all equal rows: Shows or hides rows that are equal in the left and right component.

Show/Hide all different rows: Shows or hides rows that are different in the left and right component.

Show/Hide rows that are only on the left: Shows or hides rows that exist only in the table that is contained in the left component.

Show/Hide rows that are only on the right: Shows or hides rows that exist only in the table that is contained in the right component.

Show/Hide rows that cannot be merged from left to right: Shows or hides rows that are different in the left and right component and can be merged only from the right to

the left side and not from the left to the right side.

Show/Hide rows that cannot be merged from right to left: Shows or hides rows that are different in the left and right component and can be merged only from the left to the right side and not from the right to the left side.

In addition, you can also hide all equal columns in the result grid and show only those columns where differences occur.

Show/Hide columns which don't have any differences: A toggle command that toggles the display of columns without differences on and off.

12.9.2 Navigating Differences

You can navigate through the differences by using the following navigation commands in the context menu and toolbar:

Next Difference: Selects the next difference as the current difference.

Previous Difference: Selects the previous difference as the current difference.

Last Difference: Selects the last difference in the document as the current difference.

First Difference: Selects the first difference in the document as the current difference.

Please note: The navigation commands move the selection of the current difference on row level. If there is more than one different cell in a row, you have to use the mouse cursor or the arrow keys to select any other cell than the first in a row.

12.10 Comparing Structure from within a Data Comparison

You can open a schema comparison from within a data comparison if you want to check the structure of the schema that contains a particular column. The selected tables and their corresponding tables in the other component of the comparison open in a new Schema Comparison window and are mapped automatically. If a corresponding table does not exist in the opposite component, no table is opened in the second component.

You can continue to work in the Schema Comparison window as in a [regular database schema comparison session](#) (see Comparing Database Schemas for a description of the process).

To compare the structure of selected tables:

1. Select one or more tables in either component of a Data Comparison window.
2. Right-click and choose **Open selected in new Schema Comparison** from the context menu or click the  icon in the Standard toolbar.

To compare the structure of all tables contained in a component:

- Right-click the title bar of either component and choose **Open in new Schema Comparison** from the context menu.

12.11 Editing Compared Tables

In the Comparison Result view, data **cannot be edited directly**. You can either [merge](#) the content of two compared cells (i.e., copy the content of one cell to the other cell) or retrieve data and open a new result view in the editing mode.

To edit compared tables:

1. Click the **Go to table mapping**  button to jump to the table mapping of the table you want to edit.
2. In the Data Comparison window, select the column (and the primary key column(s) of the table).
3. Right-click and select **SQL and Data | Edit Data** from the context menu.
4. Make the necessary changes in the new result window that opens in the editing mode.
5. Click the  button.
6. In the Data Comparison window, right-click the edited table and choose **Compare selected tables** from the context menu.

12.12 Merging Database Data

After you have [started a database comparison](#) in DatabaseSpy, you have several options for merging the data between the two tables:

- Merging one or more selected table(s) (left to right or right to left) in the Data Comparison window
- Merging all tables in the Data Comparison window
- Showing and executing the [merge script](#) in the SQL Editor
- Merging [single cells](#) (left to right or right to left) in the Comparison Result window

The following icons are used for merging (note that the same icons are used for different commands, depending on the menu command you select or the toolbar button you click):

Merge selected Left to Right: This command is available as toolbar button and as a context menu option in a database comparison window when at least one table is selected in the left or right component. Clicking this command replaces the table in the right component with the table in the left component.

Merge selected Right to Left: This command is available as toolbar button and as a context menu option in a database comparison window when at least one table is selected in the left or right component. Clicking this command replaces the table in the left component with table in the right component.

Merge Left to Right: This command is available in the **Data Comparison** menu and in the context menu that opens when you right-click the title bar of either component in a database comparison window. Clicking this command replaces all the tables in the right component with the corresponding tables in the left component.

Merge Right to Left: This command is available in the **Data Comparison** menu and in the context menu that opens when you right-click the title bar of either component in a database comparison window. Clicking this command replaces all the tables in the left component with the corresponding tables in the right component.

Merge data from left to right: This command is available as toolbar button and as a context menu option in the Comparison Result window when at least one cell is selected. Note that it is unimportant whether the left or the right column is selected in the result grid; data will nevertheless be copied to the right table even if the right column is selected.

Merge data from right to left: This command is available as toolbar button and as a context menu option in the Comparison Result window when at least one cell is selected. Note that it is unimportant whether the left or the right column is selected in the result grid; data will nevertheless be copied to the left table even if the left column is selected.

12.12.1 Merging Tables

When you decide to merge tables in your components, DatabaseSpy displays a dialog box providing an overview of the actions to be carried out. You must confirm the merge before the changes are actually committed to the database.

DatabaseSpy displays the databases and the affected tables, and indicates the direction in which the merge will take place. The **Show merge script** button allows you to view the changes in detail before the change script is executed. If you have selected at least one table before calling the merge command, the *Use selected Tables* radio button is selected and you can choose in the dialog box whether you want to display (and merge) only the selected or all tables.

To merge all compared tables:

1. [Select](#) and [map](#) the required tables and [run](#) a database data comparison.
2. Check the comparison result and decide which table(s) should be kept.
3. Select the appropriate menu option from the **Data Comparison** menu:
 - To copy the data from the left table, choose **Merge Left to Right**.
 - To copy the data from the right table, choose **Merge Right to Left**.
4. Do one of the following:
 - Click **Execute merge script** to commit the changes to the database.
 - Click **Show data in grid for cell based merge** if you want to [merge only selected data](#). A Comparison Result view opens for each selected table.
 - Click **Show merge script** to view—and edit, if required—the change script in an SQL Editor window. Execute the change script.

To merge selected compared tables:

1. [Select](#) and [map](#) the required tables and [run](#) a database comparison.
2. Check the comparison result and decide which table(s) should be kept.
3. Select the table(s) that you want to merge.
4. Select the appropriate menu option from the context menu or click the corresponding button in the toolbar of the Data Comparison window:
 - To copy the data from the left table, choose **Merge selected Left to Right** or click the **Merge selected from left to right**  button.
 - To copy the data from the right table, choose **Merge selected Right to Left** or click the **Merge selected from right to left**  button.
5. Do one of the following:
 - Click **Execute merge script** to commit the changes to the database.
 - Click **Show data in grid for cell based merge** if you want to [merge only selected data](#). A Comparison Result view opens for each selected table.
 - Click **Show merge script** to view—and edit, if required—the change script in an SQL Editor window. Execute the change script.

12.12.2 Displaying the Merge Script

You may want to edit the changes before they are committed to the database. For this purpose, DatabaseSpy provides a merge script that opens in an SQL Editor and can be edited.

If you choose to merge from right to left in the comparison illustrated above, the merge script would look something like that:

```

1  -- region merge from dbo.HostCities to dbo.HostCities
2  INSERT INTO [peb].[dbo].[HostCities] ([HostCityID], [City],
3  [Country], [S/W], [Year], [Comment])
4  VALUES (40, 'Vancouver', 'Canada', 'Winter', '2010', '[NULL]') ;
5  INSERT INTO [peb].[dbo].[HostCities] ([HostCityID], [City],
6  [Country], [S/W], [Year], [Comment])
   VALUES (41, 'Sochi', 'Russia', 'Winter', '2014', '[NULL]') ;
   -- endregion merge from dbo.HostCities to dbo.HostCities

```

Since the merge script opens in a new SQL Editor window, you can also edit the script before executing it.

To display the merge script for a comparison:

- Right-click a table in a comparison component and do one of the following:
 - Select **Show merge script: Left to Right** or **Show merge script: Right to Left**, respectively, from the **SQL and Data** sub-menu.
 - Select **Merge selected Left to Right** or **Merge selected Right to Left**, respectively, and click **Show merge script**.
- Select a table in a comparison component and choose the menu option **Data Comparison | SQL and Data | Show merge script: Left to Right** or **Show merge script: Right to Left**, respectively.
- [Display the results](#) of a table comparison and do the following:
 1. Select a cell that is different in the compared tables and click the **Merge data from left to right**  or the **Merge data from right to left**  button, respectively, or right-click and choose the corresponding commands from the context menu.
 2. In the **Merge Data** dialog box that appears, click the **Show merge script** button.

12.12.3 Merging Individual Results

In the Comparison Result view, you can merge single cells in the result grid, that is, copy individual cells from one column of a comparison pair to the other. This enables you to copy data from both sides of a comparison in the same result grid. Note that the changes cannot be undone and that not all rows may be merged in both directions. When rows are present only on one side of a comparison, only the entire row can be copied to the other side or deleted, respectively!

Cells that cannot be merged in both directions are marked with little arrows in red and green in the result grid, where the green arrow indicates the direction in which the merge is possible, and the red arrow indicates the direction in which a merge is not possible. If columns cannot be merged at all, an icon with two red arrows is displayed. In the example below, the left table uses the 3-digit country code and the data type of its Country column is varchar(3). The right table uses the full name of the country and stores it in a Country column of type varchar(100). Since the full names would be truncated when being copied to the 3-digit column in the left table, only merging from left to right is possible in this case.

Country	Country
GRE	Greece
FRA	France
USA	USA
GBR	United Kingdom

If you try to merge tables that contain such incompatible values, the entire row in which such a merge problem occurs is ignored during the merge. DatabaseSpy displays a message box where the changes are listed and that you have to commit before the merge is started.

In the **Merge Data** dialog box, you can still decide to merge all rows of the table or to show the merge script prior to merging.

The commands **Merge data from left to right** and **Merge data from right to left** are available as toolbar icons as well as context menu options.

To merge individual cells in the Comparison Result view:

1. In the Comparison Result view, select one or more cells that are different in the left and right table, and do one of the following:
 - Click the **Merge data from left to right**  or **Merge data from right to left**  button, respectively, which are located in the Comparison Result toolbar.
 - Right-click and select **Merge data from left to right** or **Merge data from right to left**, respectively, from the context menu.
2. In the **Merge data** dialog box that appears, click **Yes** to commit the changes to the database.

12.12.4 Reverting a Merge

In addition to [merge scripts](#) that allow you to view and edit the changes that occur during a merge before actually committing them to the database, DatabaseSpy also provides restore scripts allowing you to undo a merge.

The restore script corresponding to the merge script that has been used to insert two rows into the HostCities table in chapter "[Displaying the Merge Script](#)" is depicted below:

```
1  -- region revert merge from dbo.HostCities to dbo.HostCities
2  DELETE FROM [peb].[dbo].[HostCities] WHERE ([peb].[dbo].[
3  HostCities].[HostCityID]=41);
4  DELETE FROM [peb].[dbo].[HostCities] WHERE ([peb].[dbo].[
   HostCities].[HostCityID]=40);
5  -- endregion revert merge from dbo.HostCities to dbo.HostCities
```

Please note: You must generate the restore script **before** you execute the merge script, just like you have to create a backup file before changing the file!

To display the restore script for a comparison:

Do one of the following:

- Right-click a table in a comparison component and select **Show restore script: Left** or **Show restore script: Right**, respectively, from the **SQL and Data** sub-menu.
- Select a table in a comparison component and choose the menu option **Data Comparison | SQL and Data | Show restore script: Left** or **Show restore script: Right**, respectively.

Chapter 13

Comparing Database Schemas

13 Comparing Database Schemas

Altova web site:  [compare database schemas](http://www.altova.com/compare-database-schemas)

If you show tables in a Schema Comparison window (see screenshot below), all database items (e.g., data types, constraints, keys, etc.) are displayed in the comparison components so that you are able to compare the structure of the tables within the database schema. By default, corresponding tables and columns are mapped automatically by name after tables have been loaded into the comparison components, however you can also change this settings in the [Data Compare](#) page of DatabaseSpy's **Options** dialog box, or map items manually if you want to compare database items that have not been identified as being correspondent by DatabaseSpy.

When the [requirements](#) for a database schema comparison are met, there are several ways to start a comparison of database schemas in DatabaseSpy:

- [Opening](#) a Schema Comparison window and adding tables using the **Select Database Objects for Comparison** dialog box. Tables from both databases can be selected in the dialog box.
- Choosing the command **Comparison | Show in new Schema Comparison Document** from the context menu that opens when you right-click tables in the Online Browser. The tables from the second database can be added via the **Select Database Objects for Comparison** dialog box or by dragging them from the Online Browser into the right component in the Schema Comparison window.
- Opening a schema comparison that is included in your DatabaseSpy Project from the Project window.
- Opening a schema comparison file that is stored in your file system using the **File | Open | Open File...** command.

You can switch on the display of the Message window by activating the **Toggle Message**

Window  button in the toolbar of the Schema Comparison window. The Message window provides a list of all items that could not be mapped automatically by name and indicates that no tables have been compared yet (see screenshot below). You can check this list and map items manually, where appropriate

After [a comparison has been started](#), the schema comparison window shows the comparison results and automatically expands the tree structure so as to display the database items that are different in the left and right components (*see screenshot below*).

In the schema comparison window, you can display the Merge Script in the SQL Editor and [merge](#) the two schemas or selected items.

13.1 Prerequisites

At least one connection to a data source must be available in your DatabaseSpy Project. If this is not the case, an information box is displayed which allows you to add a data source.

Clicking **Yes** in this dialog box takes you directly to the **Create a Database Connection** dialog box where you can [define a data source connection](#). The new data source is then added to the project, DatabaseSpy connects to it, and the **Select Database Objects for Comparison** dialog box opens.

If none of your project's data sources are connected when you select the **File | New | Schema Comparison** menu option, you also cannot start a schema comparison.

Close the message box by clicking **OK** and connect to one of the data sources that are available in your project.

13.2 Opening a Database Schema Comparison Window

When opening a new Schema Comparison window, the database comparison is given a name of the form `DatabaseSchemaComparisonX`, where `X` is an integer indicating that database schema comparison's position in the sequence of database schema comparisons opened in the current DatabaseSpy session. This name appears in a tab at the bottom of the window.

The **File | New | Schema Comparison** command opens the Schema Comparison window and pops up the **Select Database Objects for Comparison** dialog box, where you must connect to the databases you want to compare (one in each component) and [select](#) the required schemas and tables. Usually you will also select the first database when opening a new Schema Comparison window. However, you could also just open a Schema Comparison window and [add](#) schemas and tables later.

To open a Schema Comparison window:

- Select the menu option **File | New | Schema Comparison** or click the **Schema Comparison**  button in the Standard toolbar (Make sure that you are connected to a data source). If the `Show table selection for new documents` check box on the [Data Compare](#) page of the **Options** dialog box is activated (default setting), the **Select Database Objects for Comparison** dialog box pops up automatically.

If you just want to open a Schema Comparison window without selecting a database yet, click **Cancel**. The **Select Database Objects for Comparison** dialog box closes and the empty Schema Comparison window is displayed in DatabaseSpy.

13.3 Selecting Schemas

Schemas or individual tables within schemas, respectively, are selected for comparison (i) in the **Select Database Objects for Comparison** dialog box or (ii) directly in the Online Browser using a context menu command. For both options an active connection to a data source is mandatory, and both options will automatically open a Schema Comparison window.

Selecting tables using a selection dialog box

If you start a new schema comparison in DatabaseSpy and want to choose the schemas or tables from both databases in a single step, this will be your preferred method. The **Select Database Objects for Comparison** dialog box can be called in various ways:

- Selecting the menu option **File | New | Schema Comparison** or clicking the **Schema Comparison**  button in the Standard toolbar opens a new Schema Comparison window and brings up the dialog box.
- If a Schema Comparison window is already open, you can either click the **Browse** button in the title bar of either component or double-click one of the title bars. The **Select Database Objects for Comparison** dialog box opens with the pane for the left or right component, respectively, selected.

In the **Select Database Objects for Comparison** dialog box, the first connected data source is suggested in the **Data Source** drop-down list. However, all data source connections of the project can be selected in the **Data Source** drop-down list of the dialog box, no matter whether they are currently connected or not. If you choose an unconnected data source, DatabaseSpy automatically establishes a connection.

If the data source containing the tables you want to compare is not included in your project and is therefore not listed in the drop-down list, you can click the **Browse** button in the Data Source group box to open the **Create a Database Connection** dialog box, where you can create the

required data source connection. Note that any data source connection created from within the **Select Database Objects for Comparison** dialog box will be automatically added to your DatabaseSpy Project!

To add tables to a comparison component via selection dialog box:

1. Make sure that a connection to a data source exists in your DatabaseSpy Project.
2. Do one of the following:
 - If you want to open a new Schema Comparison window, select the menu option **File | New | Schema Comparison** or click the **Schema Comparison**  button in the Standard toolbar. The **Select Database Objects for Comparison** dialog box opens with the **Left Side** button activated.
 - If a Schema Comparison window is already open, click the Browse button in the title bar, or double-click the title bar of either component.

The **Select Database Objects for Comparison** dialog box opens with either the **Left Side** or the **Right Side** button activated, depending on the component you have used to call the dialog box.

3. Choose one of your project's data sources from the **Data Source** drop-down list.
4. Expand the data source as required and choose the desired tables by activating the respective check boxes. Activating a folder check box selects all the tables that are contained in the folder.
5. Click the **Right Side** button (or the **Left Side** button, respectively, if you started from the right side) and repeat steps 3 and 4 for the second database.
6. Click **OK**. The selected tables are displayed in the components of the database comparison window.

Selecting tables using the Online Browser

If both data sources are connected and the tables to be compared are therefore displayed in the Online Browser you can use (i) the context menu or (ii) drag and drop to select tables for, or add tables to, a comparison.

To use the Online Browser to add tables to a comparison component:

1. Select the tables that you want to add to a comparison component in the Online Browser.
2. Right-click and do one of the following:
 - If you want to open a new Schema Comparison window, select **Comparison | Show in new Schema Comparison Document** from the context menu. A new Schema Comparison window opens and the selected tables are added to the left comparison component.
 - If you want to add tables to an existing Schema Comparison window, select **Comparison | Add to Schema Comparison Document** from the context menu. The tables are added to the component that contains the respective data source or, if the data source is not yet present in the comparison, to the empty component.
3. Alternatively, if a Schema Comparison window is already open, drag and drop tables from the Online Browser to the desired component in the Schema Comparison window.

4. Repeat step 2 or 3 for the second database.

13.4 Adding and Removing Tables

If you need to add one or more tables to a schema comparison, you can use the **Select Database Objects for Comparison** dialog box, the context menu in the Online Browser, or drag-and-drop to do so.

To add tables to an existing schema comparison:

- In the Schema Comparison window, click the **Browse** button in either component or double-click the title bar of a component to open the **Select Database Objects for Comparison** dialog box. If you have clicked into the left component, the dialog box opens for the left side of the comparison, ditto for the right side.
- Select the tables in the Online Browser, right-click and choose **Comparison | Add to Schema Comparison Document** from the context menu. The tables will be added to the component that contains the corresponding data source.
- Select the tables in the Online Browser and drag them to a component that contains the corresponding data source. Note that tables cannot be dragged onto components that contain a data source that does not match the selected tables' data source.

Removing tables from a component

A table is removed from a comparison component when you deselect its check box in the **Select Database Objects for Comparison** dialog box.

To remove a table from a component:

- Open the **Select Database Objects for Comparison** dialog box and deselect the table in the Source group box.

13.5 Saving Database Schema Comparison Files

After you have [selected](#) tables for comparison and defined the appropriate [comparison options](#), you can save the comparison in a database schema comparison file (*.dbsdif) that can be added to a project. This is either done via the **File | Save As...** command or by right-clicking the tab of a Schema Comparison window and choosing one of the **Save...** options from the context menu. If you do a particular comparison on a regular basis, the use of a schema comparison file which can be opened directly and establishes the needed data source connections automatically may save you a considerable amount of working time.

13.6 Running a Database Schema Comparison

After you have [selected](#) the schemas and tables you want to compare, you can start a database schema comparison in DatabaseSpy. Either one or more selected tables or all tables included in the active database schema comparison can be compared. A comparison can be started (i)

via the **Schema Comparison** menu, (ii) the **Start Comparison**  button in the Schema Comparison window, or (iii) the context menu, or (iv) by pressing **F5**. A comparison starts automatically when a *.dbsdif document is opened in DatabaseSpy and the **Start comparison** when opening a document check box is activated in the properties of a schema comparison file.

If not all database items could be mapped in both comparison components, unmapped items are indicated with an icon in the components, and the Message window provides a list of unmapped items.

Move your mouse cursor over the link to learn on which side of the comparison the additional item is located. This feature is especially useful in large tables with many columns where you would have to scroll to find such unmapped items.

To run a database schema comparison:

- To compare all tables in the comparison component, do one of the following:
 - Select the menu option **Schema Comparison | Compare items**.
 - Click the **Start Comparison**  button in the toolbar of the active comparison window.
 - Right-click the title bar of either component and select **Compare items** from the context menu.
 - Press **F5**.
- To restrict comparison to only some of the tables in the component:
 1. Select one or more tables in either component.
 2. Right-click and choose **Compare selected** from the context menu or press **F5**.
- To start a comparison automatically when a *.dbsdif file is opened:
 1. Save the database schema comparison into a *.dbsdif file.
 2. Activate the `Start comparison when opening a document` check box in the Properties window.

13.7 Displaying Differences in Database Schemas

After you start a comparison, DatabaseSpy tries to map the tables and columns by comparing the name and structure of the database items. The differences between the tables in the two comparison components are displayed as blocks of highlighted text.

The result of a comparison is furthermore indicated with icons in the Schema Comparison window:

The compared tables are equal in both components

Differences exist between the tables in the left and right components

A corresponding item is missing in the opposite component

For unequal or missing items, smaller versions of these icons are also displayed on column or item level, respectively.

In huge tables which contain a lot of columns, you can collapse and expand individual tables when you are examining the differences. If you double-click an item in one component, both versions of the item are collapsed or expanded, respectively, simultaneously in both components. To collapse all items in both components with a single click, use the **Collapse items** command from the **Schema Comparison** menu or the context menu that opens when

you right click the title bar of a component.

13.8 Comparing Data from within a Schema Comparison

You can open a data comparison from within a schema comparison if you want to check which data is contained in a particular column. The selected tables and their corresponding tables in the other component of the comparison open in a new Data Comparison window and are mapped automatically. If a corresponding table does not exist in the opposite component, no table is opened in the second component.

You can continue to work in the Data Comparison window as in a [regular database data comparison session](#) (see Comparing Database Data for a description of the process).

To compare the data of selected tables:

1. Select one or more tables in either component of a Schema Comparison window.
2. Right-click and choose **Open selected in new Data Comparison** from the context menu or click the  icon in the Standard toolbar.

To compare the data of all tables contained in a component:

- Right-click the title bar of either component and choose **Open in new Data Comparison** from the context menu.

13.9 Changing and Deleting Mappings

When a schema comparison is started in DatabaseSpy, tables and columns are mapped automatically according to name and structure, that is, DatabaseSpy first looks for pairs of matching names and then tries to find pairs with a similar structure (e.g., data type) that may be compared. If you feel that some of these mappings are incorrect, you can delete mappings and manually map two database items that should be compared.

To delete mappings:

Do one of the following:

- To delete all mappings of a comparison, right-click the title bar of either component and choose **Unmap items** from the context menu.
- To delete a single table or column mapping, right-click the appropriate object and choose **Unmap selected** from the context menu.
- Click the connection line between two mapped tables or columns and hit the **Del** button.

Note that unmapping a table will also unmap all columns of that table.

Changing the mapping

If you want to change an existing mapping, you can either delete the incorrect mapping and use one of the methods for [manual mapping](#) or simply re-draw the connection line between two tables. Please note that you cannot change the end point of a connection line but have to create a mapping as if no mapping would exist for the table or column in question.

In the example above, the Opening column in the right component has been incorrectly mapped to the OpenedBy column in the left component. To correct this, start at the triangle next to the Opening column on the right side and draw a connection to the OpeningCeremony column on the left side. You could also start at the OpeningCeremony column and connect it with the Opening column. The incorrect mapping between OpenedBy and Opening will disappear when the mouse button is released.

To change an incorrect mapping:

- Ignore the existing mapping and [draw a connection](#) between the two tables or columns you want to map.

13.10 Merging Database Schemas

Database schemas cannot be merged directly with a single click of the mouse. Since you could easily destroy your database this way, DatabaseSpy always displays the SQL that will be executed to commit the changes to the database in an SQL Editor window first. After you have reviewed and—if required—edited the SQL, you must execute the script to actually merge the schema structures.

To be able to merge two schemas, you must first [run](#) a schema comparison. Then you can decide whether you want to merge all items of the compared schemas or select individual items for merging. Before you can actually merge schemas in DatabaseSpy, the merge script is displayed in an SQL Editor window, where you can view, edit, and execute the SQL.

Important note: When you want to merge individual items as opposed to all tables that are contained in the comparison components, you have to select **all** items that should be merged. That is, child elements of a table or column are **not** automatically included in the merge if you select the parent. For example, if the column name is equal but the data type is different (see *screenshot below*), you must select the data type item to create a valid merge script.

A merge can be started from the **Schema Comparison** menu, the context menu for an individual item or an entire comparison component, or the  and  toolbar icons.

To show the merge script and merge items:

1. [Add](#) the required items to the Schema Comparison window and [run](#) a comparison.
2. Decide which version of the database schema should be kept (i.e., choose the left or the right comparison component).
3. Optionally, if you want to merge only specific items, select these items in a component using **Ctrl+Click**. Note that it has no influence on the direction of the merge whether you select the items in the left or in the right component (e.g., you can select items in the right component and still choose to merge from left to right).
4. Select the appropriate menu option or toolbar icon:
 - To copy the structure of the schema in the left component to the right component, choose the menu option **Schema Comparison | Show merge script: Left to Right**, select the option **Show merge script: Left to Right** from the context menu, or click the **Merge selected from left to right**  button in the toolbar of the comparison window.
 - To copy the structure of the schema in the right component to the left component, choose the menu option **Schema Comparison | Show merge script: Right to Left**, select the option **Show merge script: Right to Left** from the context menu, or click the **Merge selected from right to left**  button in the toolbar of the comparison window.

The SQL merge script is displayed in a new SQL Editor window.

5. Review and edit the merge script as required, and click the **Execute**  button to actually merge the schemas.

Chapter 14

Validating XML Data

14 Validating XML Data

Altova web site:  [XML in databases](http://www.altova.com/xml-in-databases)

If XML in databases is supported by the respective database type, you can register XML schemas with the database.

Full XML support is currently only available for the following databases:

- DB2 9
- SQL Server 2005
- SQL Server 2008

In addition, DatabaseSpy provides limited XML support for databases of the following types:

- Oracle 9
- Oracle 10g
- Oracle 11g
- PostgreSQL 8.3

In DatabaseSpy, these XML schemas are displayed in the Online Browser in a sub-folder called **XML Schemas**.

Click the expand button in front of an XML schema name to view dependent/secondary schemas. The properties of the individual XML schemas can be viewed and—where possible—[edited](#) in the Properties window.

To view an XML schema in detail, you can open it in XMLSpy. For this purpose, a context menu option in the Online Browser as well as a button in the **XML Schema management for databases** dialog box are available. You must have XMLSpy installed on your PC to be able to use this feature.

Viewing XML schemas assigned to a particular column

All the XML schemas that have been assigned to an XML data cell of a table are displayed in the Online Browser in an XML Schemas sub-folder below the respective column. This way, you can see at a glance, which XML schemas are used to validate the content of a particular XML column in the database.

To view an XML schema in XMLSpy:

Do one of the following:

- In the Online Browser, right-click a schema in the XML Schemas folder and select **View in XMLSpy** from the context menu.
- In the **XML Schema management for databases** dialog box, select a schema and click the **View Schema** button, or right-click the schema and choose **View Schema** from the context menu.

The schema opens in XMLSpy.

14.1 Assigning XML Schemas

You can assign an XML schema to a database column or, in DB2 databases, field of type XML. This schema is used for data validation when an INSERT or UPDATE action is performed. The **Choose XML Schema** dialog box lists the XML schema that is currently assigned to an XML column/data cell and allows you to assign an XML schema to the selected column/cell.

You can choose one of the existing XML schemas that are registered with the database. If you want to [add an additional XML schema](#) to the database, click the **Manage Schemas...** button.

After you have assigned an XML schema to an XML column/field, you must commit the changes to the database. At this stage, DatabaseSpy validates the XML file that is contained in the XML column/field against the assigned XML schema and reports any errors to the Message tab. If the validation fails, the XML schema assignment cannot be committed to the database.

To assign an XML schema to a database column or field of type XML:

1. Depending on the database type, do one of the following:
 - In DB2 databases, and provided that the Result window is in the Editing mode, click the Browse  button in the XML data cell you want to edit, and choose **Assign XML Schema** from the menu that appears.
 - In SQL Server databases, right-click the column in the Online Browser and choose **Assign XML Schema...** from the context menu.

The **Choose XML Schema** dialog box opens.

2. Do one of the following:
 - Select the **Schema from Database** radio button and choose one of the registered XML schemas from the drop-down list. Optionally, click the **Manage Schemas...** button to [add a schema to the database](#).
 - To remove any XML schema assignment from the column/data cell, select the **None** radio button.
3. Click **OK**.
4. Depending on the database type, do one of the following:

- In DB2 databases, click the  button in the Result window.
- In SQL Server databases, execute the change script.

14.2 Managing XML Schemas

To [add](#), [modify](#), or [delete](#) XML schemas, DatabaseSpy provides the **XML Schema management for databases** dialog box which can be accessed via a [menu command](#) or using a toolbar icon. Unless you are connected to a data source supporting XML, the dialog box appears in the Offline state.

The dialog box provides a **Connect to a database**  button which allows you to call the **Add a Data Source** dialog box and [connect to a data source](#). DatabaseSpy connects to the data source in the background and you can add, delete, or modify XML schemas for this database.

If you are connected to at least one data source, when you open the dialog, you can use the left drop-down list to select a data source connection from the project that is currently open in DatabaseSpy. If you select a connection to a database that does not support XML, or for which XML support is not yet implemented in DatabaseSpy, a corresponding information message is displayed in the list box of the dialog box.

For supported data source connections, DatabaseSpy automatically displays the XML schemas that are registered with the database in the list box of the **XML Schema management for databases** dialog box. You can then [add](#) schemas, [change](#) them, [drop](#) schemas from the database, or select an XML schema and [view it in XMLSpy](#). Any changes you make are not directly committed to the database. Edited objects are marked new (+), changed (M), or deleted (X) in the list box (see *screenshot below*). You must actively commit the changes in order for the changes to become effective.

By default, only the **Schema** and **Location** columns are displayed in the dialog box. You can, however, activate the **Show details** check box, which is located at the bottom right of the dialog box, to show also the **Schema name** (if applicable), **Namespace**, **Decomp.** (if applicable), and **Description** columns. If dependent XML schemas are present, you can view these objects by clicking the expand icon in the list box. The dialog box is resizable so as to allow you to conveniently view all the information if the **Show details** check box is activated and additional information is displayed.

All the functions in this dialog box are also available in a context menu that opens when you right-click anywhere in the list box.

To open the XML Schema management for databases dialog box:

- Select the menu option **Tools | XML Schema Management for Databases**, or click the **XML Schema Management**  icon in the Tools toolbar, or select an XML schema in the Online Browser and choose **Manage XML Schemas...** from the context menu.

Alternatively, if the Result window is in the Editing mode:

- Click the Browse button inside an XML data cell you want to edit and choose **Change XML Schema** from the popup menu.

2. In the **Choose XML Schema** dialog box, select the `Schema from Database` radio button. It is not necessary to select an XML schema from the drop-down list.
3. Click the **Manage Schemas...** button.
The **XML Schema management for databases** dialog box opens. Please note that the left drop-down list is disabled in this case. Changes can only be made for the active data source.

To connect to a different database:

- Click the **Connect to a database**  icon in the upper left part of the **XML Schema management for databases** dialog box to open the [Add a Data Source](#) dialog box. The **XML Schema management for databases** dialog box remains open in the background.

To list the available XML schemas of a database connection:

1. In the **XML Schema management for databases** dialog box, select a database from the left drop-down list or connect to a different database as described above.
2. If required, select a database schema from the right drop-down list.
3. Optionally, activate the `Show details` check box to display also namespace, decomposition, and description of the listed XML schemas.

14.3 Adding XML Schemas

You can register additional XML schemas with a database and later assign these schemas to individual XML fields of the database. In the **XML Schema management for databases** dialog box, these newly added XML schemas are marked new (+) in the list box, and must be confirmed before they are actually registered with the database's XSR repository.

Before you commit the changes to the database, you can view the XML schema in XMLSpy or change its description or decomposition properties in the dialog box.

All actions that you perform in the **XML Schema management for databases** dialog box are reported in the Report tab which works the same way as the Output window in DatabaseSpy.

After an XML schema has been successfully registered with the database, it appears in the **XML Schemas** sub-folder of the Online Browser.

To register an XML schema with the database:

1. In the **XML Schema management for databases** dialog box, select a database connection from the left drop-down list if no data source connection is active.
2. Click the **Add Schema...** button or right-click anywhere into the list box and select **Add Schema...** from the context menu.
The standard Windows **Open** dialog box appears.
3. Browse to the location of the required XML schema file and click **Open**.
The XML schema appears in the list of available XML schemas and a **New**  icon indicates that this XML schema has not been committed to the database yet.
4. Optionally, double-click the file name of the XML schema and edit the name as desired.
5. Optionally, activate the **Show details** check box and enter a description for the XML file.
6. Optionally, activate the **Decomp.** check box or right-click the XML schema and activate the **Decomposition** option in the context menu to enable the XML schema for decomposition, if applicable.
7. Optionally, change the database schema in the **DB schema** column, if applicable.
8. Click the **Commit changes** button.
9. Click **Close** to exit the dialog box. If any changes have not been committed yet, a prompt appears, asking you whether you would like to commit or discard the changes.

14.4 Modifying XML Schemas

DatabaseSpy allows you to change certain parameters of XML schemas that are registered with the database. You may have to activate the `Show details` check box in the **XML Schema management for databases** dialog box to see all the properties.

When you [add](#) a new XML schema to the database, you can edit the schema name and the location information in the **XML Schema management for databases** dialog box **before** you commit the new schema to the database.

Once an XML schema has been registered with the database, only the schema description and the decomposition property can be changed. This can be done either in the **XML Schema management for databases** dialog box or in the Properties window.

Please note: Although you can edit an XML schema that you have opened for viewing in XMLSpy, you **cannot save back a schema to the database**. Any changes you make in XMLSpy must be saved in a new XML schema file!

To change XML schema properties:

1. Select the menu option **Tools | XML Schema Management for Databases** or click the **XML Schema Management**  icon in the Tools toolbar, or right-click an XML schema in the Online Browser and choose **Manage XML Schemas...** from the context menu.
2. In the **XML Schema management for databases** dialog box, select an XML schema in the list box.
3. Optionally, activate the `Show details` check box if the `Namespace`, `Decomp.`, and `Description` columns are not displayed.
4. If applicable, change the status of the `Decomp.` check box as required. The XML schema is enabled for decomposition if the decomposition property is checked.
5. If applicable, change the database schema in the `DB schema` column as required.
6. Edit the schema description as required.
7. Click the **Commit changes** button to confirm your changes.
8. Click **Close** to exit the dialog box. If any changes have not been committed yet, a prompt appears, asking you whether you would like to commit or discard the changes.

Alternatively, do the following:

1. Select an XML schema in the Online Browser and edit the properties in the properties window.
2. Execute the change script to commit your changes to the database.

14.5 Deleting XML Schemas

The **XML Schema management for databases** dialog box can also be used to remove an XML schema from a database. Upon clicking the **Drop Schema** button, the schema is marked for deletion (✖) in the list box and you have to confirm the deletion before the schema is actually dropped from the database's XSR repository.

The **XML Schema management for databases** dialog box also provides a **Remove Drop Flag** button that allows you to undo the deletion, provided that the changes have not been committed yet.

Alternatively, you can also use an option in the context menu of the Online Browser to delete XML schemas from the database. The XML schema is marked for deletion in the Online Browser and a database structure change script is generated which must be executed to commit the deletion to the database.

Please note: If you delete an XML schema from the XML Schemas sub-folder of a database column (i.e., from the sub-folder that shows the XML schemas assigned to a certain column of a database table), the XML schema will be deleted from the database's XSR repository and not just removed from the column.

To delete a registered XML schema from the database:

1. In the **XML Schema management for databases** dialog box, select a database connection from the left drop-down list if no data source connection is active.
2. Select the XML schema you want to delete and click the **Drop Schema** button. The XML schema is marked for deletion (✖) in the list box. Alternatively, you can also right-click the schema and select **Drop Schema** from the context menu.
3. Click the **Commit changes** button.
4. Click the **Close** button to exit the dialog box. If any changes have not been committed yet, a prompt appears, asking you whether you would like to commit or discard the changes.

Alternatively, do the following:

1. In the Online Browser, right-click the XML schema you want to delete and select **Delete**

from the context menu. Alternatively, you can also select the XML schema and press the **Delete** key.

A change script is generated in the Database Structure Change Script window and the XML schema is marked for deletion  in the Online Browser.

2. In the Database Structure Change Script window, click the **Execute Change Script**  button.

To undo the deletion of an XML schema:

1. In the **XML Schema management for databases** dialog box, select an XML schema that is marked for deletion.
2. Click the **Remove Drop Flag** button or select the option **Remove Drop Flag** from the context menu.
3. Click the **Close** button. A prompt appears, asking you whether you would like to commit or discard the changes.
4. Click **Yes**.

Chapter 15

Importing Database Data

15 Importing Database Data

Altova web site:  [database import/export](http://www.altova.com/database-import-export)

DatabaseSpy currently allows you to import data contained in XML or CSV files to your databases. When you click the **Import**  button in the Tools toolbar or select the menu option **Tools | Import data to the database... (Ctrl+I)**, the **Import data to the database** dialog box opens where you can select the XML or CSV file to be imported and define the import options. The **Import data to the database** dialog box contains two tabs, Selection and Options.

The screenshot shows the 'Import data to the database' dialog box with the 'Options' tab selected. The dialog is divided into several sections:

- Source:** A text box for 'Path' containing 'C:\Documents and Settings\john.doe\My Documents\Altov' and a browse button (...).
- Destination:** Three dropdown menus for 'Data Source' (ZooDBConnect), 'Database' (ZooDB), and 'Schema' (dbo).
- Database Generation Options:** Three radio buttons: 'Create new table(s)', 'Update/Create if not existing', and 'Update existing tables' (which is selected).
- Stop after errors:** A spinner box set to '100'.
- Stop action:** A dropdown menu set to 'commit'.
- Import Mode:** Two radio buttons: 'Execute' (selected) and 'Generate SQL in SQL Editor'. There is also a 'Log' checkbox and a file path text box with a browse button (...).

The lower part of the dialog box always shows a preview of the selected data, which can be updated to reflect the selected options.

You can choose to preview the data (*screenshot above*) or the definition (*screenshot below*) of the selected element's table structure.

All fields will be created as Text fields with the length specified in the Options tab. You can change the data type separately for every column in the Preview group box if you select the **Show Definition** radio button (*see screenshot above*).

To import database data from a text file:

1. Make sure that a data source is active in the project folder.
2. Select the menu option **Tools | Import data to the database**, or press **Ctrl+I**, or click the **Import**  button in the Tools toolbar. The **Import data to the database** dialog opens.
3. In the Source group box, enter the Path to the text file you want to import. You can type it in, select it from the drop-down list, or click the **Browse**  button.
4. In the Destination group box, select where you want to import the data to. If you previously selected a data source, the three fields are automatically filled in, if not:
 1. Select the data source, database, and schema from the drop-down lists.
 2. Select **Create new table(s)**, **Update/Create if not existing**, or **Update existing tables**, depending on where you want to import the data.
 3. In the **Stop after errors** drop-down list, specify the number of errors after which the import process should be stopped.
 4. In the **Stop action** drop-down list, select the action to perform when import is stopped: **Commit** commits the tables that did not contain errors; **rollback** does not

commit any imported data.

5. In the Import Mode group box, do one or more of the following:
 - Activate the `Execute` radio button if the necessary SQL should be generated and executed in one step.
 - Activate the `Generate SQL in SQL Editor` radio button if the generated SQL file should be placed in the SQL Editor ready for execution.
 - Check the `Log` check box to activate the drop-down list where you can enter the name and path of the SQL log, select a previously used log file, or select an existing log file by clicking on the **Browse**  button.
6. Click the **Apply Options** button to preview the data and further define the import settings.
7. Click the `Show Data` or `Show Definition` radio button to edit the different aspects of the table structure.
8. Double-click a field in the preview window to edit the data type, nullability, or indexing. Define how/whether you want to import each column by clicking the column header to change it.

Import

Import as unique key

Import as primary key

Do not import

9. Click **Import**.
If the `Execute` radio button is selected in the Import Mode group box, the text file is imported into the database and a prompt appears asking if you want to view the log.sql file. You may have to execute the generated SQL script first to import the text file into the database.

15.1 Defining XML Import Options

The Options tab of the **Import data to the database** dialog box allows you to define the options when importing data from files to the database. When the XML icon on the left side of the dialog box is selected, you may change the import options for files of type XML.

The screenshot shows the 'Options' tab of the 'Import data to the database' dialog. The 'Start point of import' section has 'Starting from' selected with a dropdown menu. The 'Import depth' section has 'Import all sub-elements' selected. The 'Import fields' section has 'Create from attributes', 'Create from text values', and 'Convert entities to text' checked. The 'Automatic fields' section has 'Create primary/foreign keys' checked. The 'Other options' section has 'Exclude namespace name' selected, and the 'Create text fields with length' is set to 255.

Start point of import

You can choose to import the entire XML document or restrict your import to the data hierarchy starting from the currently selected element. The number of sub-levels below the start point that will be imported is specified in the Import Depth option.

Import depth

Specifies the number of sub-levels below the start point that will be imported.

Import fields

Depending on your XML data, you may want to import only elements, attributes, or the textual content of your elements. Note that you can deselect the import of individual elements in the Preview window.

Automatic fields

DatabaseSpy will produce one output file or table for each element type selected. You can choose to automatically create primary/foreign key pairs to link your data in the relational model, or define a primary key for each element.

Other options

The `Exclude namespace name` radio button, together with the `Replace Colon With Underscore` radio button, is an either/or choice. Specifies whether namespace prefixes of elements and attributes should be excluded or whether the colon in the namespace prefix should be replaced with an underscore.

Text strings in the XML document that should be treated as NULL values as well as the length of text fields in the database can be specified.

15.2 Defining CSV Import Options

When the CSV icon on the left side of the dialog box is selected, you may change the import options for files of type CSV on the Options tab of the **Import data to the database** dialog box.

The screenshot shows the 'Options' tab of a dialog box. It contains the following settings:

- ☒ First row contains column names
- Treat this as NULL values: [Empty dropdown]
- Delimiter: [Comma]
- String quotes: [Empty dropdown]
- Encoding: [Codepage 1252 (Western)]
- Byte order: [Little-endian byte order]
- Create text fields with length: [255]

Options

If the files you are importing contain column names, select the `First row contains column names` check box to exclude them from the import. In the `Treat this as NULL values` drop-down list, you can choose the character that should be recognized as a NULL value in the file being imported. The delimiter character and the quotes to be used to identify strings can also be selected from the respective drop-down lists. In the `Encoding` drop-down list, select the encoding of the files you are importing from the drop-down list. If a two- or four-byte encoding is selected as the default encoding (i.e., UTF-16, UCS-2, or UCS-4), you can choose between little-endian and big-endian byte ordering. A fixed length of the text fields being imported can be defined in the `Create text fields with length` field.

Chapter 16

Exporting Database Data

16 Exporting Database Data

Altova web site:  [database import/export](http://www.altova.com/database import/export)

DatabaseSpy can export database data to a number of file formats such as XML, XML

Structure, CSV, HTML, and Excel. When you click the **Export**  button in the Tools toolbar or select the menu option **Tools | Export database data... (Ctrl+E)**, the **Export database data** dialog box opens, where you can select the data to be exported and define the export options for the individual export file types. The **Export database data** dialog box contains two tabs, Selection and Options, where the [Selection](#) tab is the same for all export types while each export file type has an Option tab of its own. You can change the export file type by clicking on the respective icon in the left area of the dialog box.

The Source group box basically is a depiction of the [Online Browser window](#) with all its features and options. In addition, you can select the individual tables for export here. Please note that the default layout in the Source group box for XML, CSV, HTML, and Excel is [Folders](#) while it is [Table Dependencies](#) for XML structure. You can, however, change the layout by clicking on the

Layouts  button in the Source group box.

Exporting structured XML

The structured XML export option exports table data in an hierarchical fashion.

```
<import>
  <parentTable>
    <name>...</name>
    ...
    <childTable>
      <childname>...
      <grandchildTable>
    </childTable>
```

```
<?xml version="1.0" encoding="UTF-8"?>
<Import>
  <tblAnimalTypes>
    <AnimalTypeID>1</AnimalTypeID>
    <EnglishName>Parma wallaby</EnglishName>
    <LatinName>Macropus parma</LatinName>
    <AreaOfOrigin>Australia</AreaOfOrigin>
    <Category>1</Category>
  </tblAnimalTypes>
  <tblAnimalTypes>
    <AnimalTypeID>2</AnimalTypeID>
    <EnglishName>Freshwater Butterflyfish</EnglishName>
    <LatinName>Pantodon buchholtzi</LatinName>
    <AreaOfOrigin>Asia</AreaOfOrigin>
    <Category>2</Category>
  </tblAnimalTypes>
```

16.1 Selecting Database Data for Export

The Selection tab of the **Export database data** dialog box is the same for all export file types. The option that has been used last is active by default. If you want to export your database data to a different file format, select the respective icon on the left side of the dialog box and change to the Options tab in order to define the export options for [XML](#), [XML Structure](#), [CSV](#), [HTML](#), or [Excel](#).

The Source group box of the **Export database data** dialog box provides a toolbar containing the same icons as the Online Browser ([layout](#), [filter](#), [favorites](#), and [Object Locator](#)) as well as the **Show checked objects only**  icon. The latter is useful if you have a large number of tables in your database and want to export data from only a few of them. After you have activated the check boxes of the appropriate tables, clicking the **Show checked objects only**  icon displays only the tables that you have selected for export and hides the tables not concerned.

To export database data:

1. Make sure that a data source is active in the project tab.
2. Select the menu option **Tools | Export database data**, or press **Ctrl+E**, or click the **Export**  button in the Tools toolbar.
The **Export database data** dialog box opens.
3. Click the desired icon on the left side of the dialog.
4. In the Source database group box, select the data source from the drop-down list.
5. Select the data you want to export in the Source group box.
Do one of the following:

- The **Table** radio button is selected by default. The data source you selected above is displayed as it appears in the [Online Browser](#). The [filter](#) and [favorites](#) functions as well as the [object locator](#) are all available in the toolbar.
- Clicking the **SQL** radio button displays SQL commands or allows you to enter them directly.
Please note: If the you have opened the **Export database data** dialog box from the toolbar of the SQL Editor window and not from the Tools toolbar, the **SQL** radio button is active by default and the contents of the SQL Editor window appear in the text box.
- If you select tables while the **Table** radio button is selected and then click the **SQL** radio button, the SELECT statements for those tables will be generated automatically and appear in this window.

```
1 SELECT [BirthID], [BirthDate], [Mother], [Father], [Veterinarian],  
   [NumberInLitter] FROM [ZooDB].[dbo].[tblAnimalBirths];  
2 SELECT [FeedTypeID], [FeedName], [AmountInStock], [Supplier],  
   [AmountOrdered] FROM [ZooDB].[dbo].[tblAnimalFeed];  
3 SELECT [AnimalTypeID], [EnglishName], [LatinName], [AreaOfOrigin],  
   [Category] FROM [ZooDB].[dbo].[tblAnimalTypes];  
4
```

6. If required, change the database you want to export the data from by clicking on the arrow to the right of the database name and selecting a database from the drop-down list.
7. Activate the check boxes of the tables you want to export from the database.
8. Specify the Destination to which you want to export the data. Do one of the following:
 - Optionally, enter a prefix that will be added to the table name when the table is exported.
 - Select **Path** and enter a path in the field or use the **Browse**  button.
 - Select **Export to XMLSpy**.
9. Select the table you want to preview and click the **Preview** button in the Preview group box.

Please note that the **Preview** button is only activated if a table is selected. The table data now appears in the Preview group box and the **Preview** button changes to **Reload**.

- For each column, click the icon next to the column name to select whether you want it to be exported to the export file as an element , an attribute , or not appear at all .

In order to restore the original setting click the **Reload** button.

- Change the file name of the selected table in the `Export Table Name` field, if necessary.
- Click **Export**.
Each of the selected tables is exported to a separate file. A message appears that informs you about the successful export of your database data.

Exporting data from designs

If you have a specific design open in a Design Editor window, you can easily export the data that is contained in the tables of this particular design. The Design Editor window provides an additional **Export**  button which is active if at least one table in the Design Editor window is selected. When you click this button, the **Export database data** dialog box opens with the `Table` radio button activated and the check box(es) of the selected table(s) already checked. You can still add additional tables to the export definition.

Please note: Clicking the **Export**  button in the Tools toolbar will also open the **Export database data** dialog box. However, in this case no tables will be preselected for export.

To export data from a Design Editor window:

1. Make the Design Editor window whose tables you want to use for export the active window and select at least one table.
2. Press the **Export**  button in the Design Editor window.
The [Export database data dialog box](#) opens. The tables that are currently selected in the Design Editor are already preselected in the Source group box.
3. Do one of the following:
 - Activate the `Path` radio button and enter the Path you want the destination files to appear in.
 - Activate the `Export to XMLSpy` radio button if you want your exported data to be displayed in XMLSpy.
Note that this option is not available for export to Excel files.
4. In the Source group box, select a table and click the **Preview** button in the Preview group box.
5. Optionally, change the file name in the `Export Table Name` field.
6. If required, exclude columns from export or export them as attributes.
7. Optionally click the Options tab to change the options for [XML](#), [XML Structure](#), [CSV](#), [HTML](#), or [Excel](#).
8. Click the **Export** button when all the settings are correct.
A message box appears to inform you about the success of the export.
9. Click **OK**.
The data is exported under the name specified in the `Export Table Name` field in the desired format and either stored under the path you specified or opened in XMLSpy for further editing.

16.2 Defining XML and XML Structure Export Options

In the Options tab for XML and XML Structure you can define the appearance of the exported files.

To define the extended options for XML and XML Structure export files:

1. Choose one of the following options for the format of number, date, and time values:
 - According to system locale
 - Compatible with Schema data types
2. Choose one of the following options for the default data type:
 - Select `Elements` by default to export the data as elements
 - Select `Attributes` by default to export the data as attributes

Please note: You can change individual columns in tables to be exported as elements or attributes in the Preview group box of the dialog.
3. If you want to exclude primary and foreign keys from the export file, activate the `Exclude Primary/Foreign Keys` check box.
4. Activate the `Include comments` check box to include an attribute in the exported XML file that shows the SQL query used to select the data, as well as a list of comments containing one item for each column header in the database table.
5. Activate the `Create elements from NULL-fields` check box to include an empty element for each null value in the data being exported.
6. Optionally select from the `Substitution for NULLs` drop-down list or type in the string that should appear in the XML file when there is a NULL value in the data being exported.
You can also type in a value that is not contained in the drop-down list. This option is only available if the `Create elements from NULL-fields` check box is activated.

7. Select the desired encoding for the files that are generated during export from the `Encoding` drop-down list.
8. If a two- or four-byte encoding is selected as the default encoding (i.e., UTF-16, UCS-2, or UCS-4), you can choose between little-endian and big-endian byte ordering.

16.3 Defining CSV Export Options

In the Options tab for CSV files, you can choose from among several options concerning the appearance of the CSV file that is created as a result of the export.

To define the extended options for CSV export files:

1. Activate the `Include comments` check box to include an attribute in the exported CSV file that shows the SQL query used to select the data, as well as a list of comments containing one item for each column header in the database table.
2. Activate the `Remove delimiters` check box to remove delimiters that are contained in text values in the exported data. Set the delimiter you want to remove by using the `Delimiter` drop-down list, the second drop-down list in this tab. For example, if this option is activated and you export a table containing the string "Ba'ker", the string will be "Baker" in the exported text.
3. If the exported tables is to include the database column names, activate the `Include column headers` check box.
4. Select the `Remove newlines` check box if you want to remove newlines from exported data.
5. Select from the `Substitution for NULL-values` drop-down list or type in the string that should appear in the CSV file when there is a NULL value in the data being exported. You can also type in a value that is not contained in the drop-down list.
6. Select from the `Delimiter` drop-down list the character you would like to use to delimit columns in the text file or enter the desired character string.
7. If you want to put each string into quotes, select the desired character from the `String quotes` drop-down list. You can also type in a character that is not contained in the drop-down list.
8. Select the desired encoding for the files that are generated during export from the `Encoding` drop-down list.
9. If a two- or four-byte encoding is selected as the default encoding (i.e., UTF-16, UCS-2, or UCS-4), you can choose between little-endian and big-endian byte ordering.

16.4 Defining HTML Export Options

The Options tab for HTML files provides some settings that apply to exported HTML files.

To define the extended options for HTML export files:

1. Activate the `Include comments` check box to include a comment in the HTML code of the exported HTML file that shows the SQL query used to select the data, as well as a list containing one item for each column header in the database table.
2. If the HTML table generated is to include the database column names, activate the `Include column headers` check box.
3. Select from the `Substitution for NULL-values` drop-down list or type in the string that should appear in the exported HTML file when there is a NULL value in the data being exported.
You can also type in a value that is not contained in the drop-down list.
4. Select the desired encoding for the files that are generated during export from the `Encoding` drop-down list.
5. If a two- or four-byte encoding is selected as the default encoding (i.e., UTF-16, UCS-2, or UCS-4), you can choose between little-endian and big-endian byte ordering.

16.5 Defining Excel Export Options

For Excel export files, you can only define whether comments and column headers are to exported and specify a substitution for NULL values.

To define the extended options for Excel export files:

1. Activate the `Include comments` check box to include a comment in the Excel code of the exported Excel file that shows the SQL query used to select the data, as well as a list containing one item for each column header in the database table.
2. If the Excel table generated is to include the database column names, activate the `Include column headers` check box.
3. Select from the `Substitution for NULL-values` drop-down list or type in the string that should appear in the exported Excel file when there is a NULL value in the data being exported.
You can also type in a value that is not contained in the drop-down list.

Chapter 17

DatabaseSpy Settings

17 DatabaseSpy Settings

The **Tools | Options** command enables you to define global application settings. These settings are specified in a dialog box with a navigation pane and saved in the registry. They apply to all current and future document windows. The **Apply** button in the **Options** dialog displays the changes in the currently open documents and fixes the current settings. The changes are seen immediately in the background windows. Each dialog page provides also a **Reset to Page Defaults** button which sets all changes you made on this page back to the default settings.

Each page of the **Options** dialog is described in detail in this section.

To change DatabaseSpy settings:

1. Select **Tools | Options...** or press **Ctrl+Alt+O**.
The **Options** dialog box appears.
2. In the navigation pane, select the dialog pages for the following options:
 - [General](#)
 - [SQL Editor](#)
 - [Design Editor](#)
 - [Data Compare](#)
3. Make the desired changes and click **OK**.

17.1 General Options

The main page of the General options defines the general appearance of DatabaseSpy as well as general options when working with the application. Related settings are defined in the [Online Browser](#), [Change Script](#), [File Types](#), and [Encoding](#) options.

The screenshot shows the 'General: General' settings window. It has a title bar with a close button and a 'Reset to Page Defaults' button. The settings are organized into several groups:

- Application Startup:** Two checked checkboxes: 'Open last project on startup' and 'Show create a database connection dialog'.
- Program Logo:** Two checked checkboxes: 'Show on startup' and 'Show on print'.
- Line Breaks:** Three radio buttons: 'Preserve old' (selected), 'CR & LF', 'CR', and 'LF'.
- Frame Title:** Two radio buttons: 'File name only' (selected) and 'Full path name'.
- Automatic reload of files:** Two checkboxes: 'Watch for file changes' (unchecked) and 'Ask before reload' (checked).
- Connection Wizard:** One checkbox: 'Skip configuration step in connection wizard' (unchecked).
- Newly saved files:** Two checkboxes: 'Automatically add newly saved files to project' (unchecked) and 'Do not show dialog' (unchecked).

Application Startup

You can choose to automatically open the project file that was open when you last closed DatabaseSpy or to have the **Add a Data Source** dialog box displayed when DatabaseSpy is started. If you do not choose any of the options in this group box, you must open files or projects in DatabaseSpy via the **File** menu.

Program Logo

Choose whether you want the DatabaseSpy logo displayed when the application is started and whether it should appear on top of a print-out you make.

Line Breaks

When you open a file, the character coding for line breaks in it is preserved if `Preserve old` is selected. Alternatively, you can choose to code line breaks in any of three codings: `CR&LF` (for PC), `CR` (for MacOS), or `LF` (for Unix).

Frame Title

The frame title in DatabaseSpy shows the project name and the name of the object that is currently active in the SQL Editor or the Design Editor, respectively. You can choose whether you want to see just the file name or the entire path of the object in the frame title of the application.

Automatic reload of files

If you are working in a multi-user environment, or if you are working on files that are dynamically generated on a server, you can watch for changes to files that are currently open in the interface. Each time DatabaseSpy detects a change in an open document, it will prompt you about whether you want to reload the changed file.

Connection Wizard

If you activate the `Skip Configuration Step in Connection Wizard` check box, the

Configure page in the **Add a Data Source** dialog box is skipped and clicking **Next** in the first dialog page of the **Add a Data Source** dialog box will bring you directly to the **Data Link Properties** dialog box.

Newly saved files

You can automatically add files to your project when you save them to the file system or suppress the display of the respective dialog box.

17.1.1 Online Browser

The Online Browser section of the **Options** dialog box lets you configure layout and behaviour aspects of the Online Browser.

Context Menu Action for SQL Editor

Specify the default action taken when an object is dragged and dropped from the Online Browser to the SQL Editor. You can specify a different default action for each database object type.

Display Labels

You can have DatabaseSpy display labels that are displayed as a prefix in front of the names in the Online Browser or the Project window. For example, table names are prefixed with the word "Table" and columns with the word "Column" in the Online Browser, or data sources are prefixed with the word "Data Source" in the Project window.

To not show the connection method for data sources in the Online Browser and Project windows, deactivate the respective check box.

Show connection method
in Project window:

Hide connection method
in Online Browser:

Please note that you can show or hide the connection method only for both the Project window and the Online Browser; this option cannot be set individually for the two of them.

Appearance

When the `Enable full row selection` check box is activated, in the Online Browser the row in which the cursor is currently positioned is highlighted and you can click to select the row without having to move the cursor exactly over the text of the row. From the drop-down list, you can choose a color to be used for selecting.

If you prefer a wider display of you database data, you can deactivate the `Reduce vertical spacing` check box. This option applies to both Project window and Online Browser.

The `Optional display of Table and View row counts` check box is activated by default, allowing you to show the number of data rows of a table or view without having to retrieve data first.

Case Sensitivity for Object Locator

When searching and filtering database objects, you can decide whether or not this should be case sensitive.

17.1.2 Change Script

The Change Script section of the **Options** dialog box lets you configure the script generation and execution of the Database Structure Change Script.

Database Structure Change Script

The Database Structure Change Script can be generated either instantly when a change occurs, or on demand. In the latter case, you must generate the change script manually by

clicking on the **Update Change Script**  icon. In this group box, you can also define the time delay during execution of the change script. Choosing `Slow`, for example, increases the time

delay and gives you the opportunity to cancel the execution of the change script at a certain stage.

Confirmation Messages

DatabaseSpy can display a popup alarming you that a change script has been generated when a database object is edited for the first time. You can turn off this message by deactivating the `Show hint on the first database edit operation` or by activating the `Don't show this dialog again!` check box in the dialog box.

If you want DatabaseSpy to inform you when a change script is created, but do not want to have the details displayed, click the **Hide Details** button and the dialog will appear in a minimized form next time.

17.1.3 File Types

The File Types section of the **Options** dialog box allows you to customize the behavior of DatabaseSpy on a per-file-type basis.

Windows Explorer settings

You can define the file type description and MIME-compliant content type used by Windows Explorer and whether DatabaseSpy is to be the default editor for documents of this file type.

Conformance

DatabaseSpy provides specific editing and other features for various file types. The features for a file type are set by specifying the conformance in this option. DatabaseSpy lets you set file type to conform with SQL and other (text) grammars. A large number of file types is defined with a default conformance that is appropriate for the file type. We recommend that you do not modify these settings unless you are adding a new file type or deliberately wish to set a file type to another kind of conformance.

Add new file extension

Adds a new file type to the File types list. You must then define the settings for this new file type using the other options in this section.

Delete selected file extension

Deletes the currently selected file type and all its associated settings.

17.1.4 Encoding

In the Encoding section of the **Options** dialog box, you can specify several options for file encodings.

**Default encoding for new SQL files**

Define the default encoding for new files so that each new document includes the encoding-specification that you specify here. If a two- or four-byte encoding is selected as the default encoding (i.e., UTF-16, UCS-2, or UCS-4), you can also choose between little-endian and big-endian byte ordering for the SQL files.

The encoding for existing files will, of course, always be retained.

Open SQL files with unknown encoding as

You can select the encoding with which to open an SQL file with no encoding specification or where the encoding cannot be detected.

Please note: SQL files which have no encoding specification are correctly saved with a UTF-8 encoding.

BOM (Byte Order Mark)

When a document with two-byte or four-byte character encoding is saved, the document can be saved either with (i) little-endian byte-ordering and a little-endian BOM (Always create BOM if not UTF-8); or (ii) the detected byte-ordering and the detected BOM (Preserve detected BOM on saving).

17.2 SQL Editor Options

The main page of the SQL Editor options defines the visual appearance of the editor. Additional SQL Editor-related settings are defined in the [SQL Generation](#), [SQL Formatting](#), [Autocompletion](#), [Autoinsertion](#), [Result View](#), and [Fonts](#), options.

SQL Editor [Reset to Page Defaults]

General

☒ Enable syntax coloring ☐ Connect data source on execute

Retrieval

☒ Show timeout dialog Execution timeout (in seconds): 60

Buffered amount (rows): 200

Entry Helper Buffer

☐ Fill buffer on connect ☒ Fill buffer the first time it is needed

The Entry Helper Buffer is used by auto-completion and auto-insertion and requires some time to populate itself.

[Clear Buffer]

[Text View Settings...]

General

Syntax coloring emphasizes different elements of SQL syntax using different colors. By activating the `Connect data source on execute` check box, you can have DatabaseSpy connect to the corresponding data source automatically whenever an SQL file is executed and its data source is not connected.

Retrieval

You can have DatabaseSpy display a dialog box asking you whether you want to change the time out settings when the permissible execution period is exceeded. Specify the maximum amount of time that is permissible for the execution of retrievals. The number `n` you enter into the `Buffered Amount (Rows)` field will appear in the context menu of the Online Browser if you select the **Retrieve data | First `n` rows** option.

Entry Helper Buffer

The entry helper buffer for autocompletion and auto-insertion can be filled either when you connect to a data source or when it is used for the first time. Note that filling the buffer may take some time. Use the **Clear Buffer** button to reset the buffer.

Text View Settings

[Text view settings](#) are defined in a separate dialog box, which can be accessed via the **Text View Settings** button.

17.2.1 Generation

The Generation section of the **Options** dialog box lets you configure how the statements are generated.

Statement generation options

Use the `Select a database` field list to select a database kind and set the statement generation options individually for the different database kinds you are working with. Activating the `Apply to all databases` check box sets the options that are currently selected for all databases.

When the `Append semicolons to statement end` check box is activated, a semicolon is appended when you generate an SQL statement in the SQL Editor. Note that editing of data in Oracle databases and IBM iSeries and DB2 databases via a JDBC connection is possible only if this check box is unchecked.

By default, identifiers in SQL statements are enclosed in database-specific escape characters. You can deactivate the `Surround identifiers with escape characters` check box if you do not want to display these characters.

The `Generate SELECT statements with full column list` check box is also activated by default. If you prefer `SELECT * FROM ...` when retrieving all columns of a table, deactivate it.

Confirmation Messages

When you have deactivated the `Append semicolons to statement end` check box and activated the `Show warning when editor enforces semicolons and SQL generation does not` check box, DatabaseSpy will display a message box if you activate the `the SQL Editor should require semicolons` check box in the SQL Editor properties.

If you are sure that the statement is correct, you can click **Yes** and execute the statement as it appears in the SQL Editor. Clicking **No** will abort the execution so that you can correct the statement.

17.2.2 Formatting

The Formatting section of the **Options** dialog box lets you switch off SQL formatting for the SQL Editor and Change Script windows and configure the behavior of open SQL Editor windows.

SQL Formatting

You can disable the SQL formatting options for the Change Script window and/or the SQL Editor by deactivating the respective check boxes. Note that in the Change Script window, SQL formatting is applied automatically when the next change is recorded, and that you cannot apply formatting without changing the database structure.

Update behavior after changing Formatting Configurations

This group box allows you to specify whether or not open SQL Editor windows should be automatically updated after formatting configurations have changed or if a prompt should be displayed, where you can choose to update the windows or to keep the existing formatting.

SQL Formatting Configurations

The **SQL Formatting Configurations...** button opens the **SQL Formatting Configuration** dialog box, where you can [define the configurations](#) for the different database types or disable formatting on database or even statement type level.

17.2.3 Autocompletion

The Autocompletion section of the **Options** dialog box lets you configure the autocompletion function and defines how the autocompleted items are inserted into the SQL Editor window.

SQL Editor: Autocompletion Reset to Page Defaults

Triggering Autocompletion

☐ Manually trigger autocompletion using the Ctrl+Space keys

☒ Automatically open after (delay in milliseconds):

Completion Keys

☒ Enter ☒ Comma (,)

☒ Tab ☒ Parentheses ()

☒ Spacebar ☒ Semicolon (;)

☒ Dot (.) ☒ Closing Identifier character*

Statistics

☒ Prioritize using statistics

Reset all language statistics

Insertion Behaviour

☒ Uppercase keywords

☒ Surround identifiers with escape characters* (database specific)

Triggering Autocompletion

You can define whether the autocompletion popup should be triggered automatically after a delay which you can set here, or if the popup has to be invoked manually.

Completion Keys

Several keys can be used to insert the selected completion into the SQL Editor window. Deactivate the check boxes for the keys that you do not want to use for this purpose.

Statistics

The SQL Editor can intelligently suggest autocompletion entries based on language statistics. If this feature is activated, items that are frequently used appear on top of the list of suggested entries.

Insertion Behaviour

Keywords can be inserted in uppercase, and you can automatically add the database-specific escape characters to identifiers when they are inserted via autocompletion.

17.2.4 Autoinsertion

The Autoinsertion section of the **Options** dialog box lets you configure the options that apply for text that is inserted automatically into the SQL Editor.

SQL Editor: Autoinsertion Reset to Page Defaults

Closing Characters

- ☒ Autoinsert closing characters
 - ☒ Comment mark (/* and --; wrapping only)
 - ☒ Identifier escape characters (database-specific)
 - ☒ Parenthesis ()
 - ☒ String quotes (database-specific)

Behaviour

- ☒ Delete closing characters when opening character is deleted
- ☒ Wrap selected text when autoinserting

Star Expansion

- ☒ Expand columns with tab

Closing Characters

You can disable the autoinsertion of closing characters completely by deactivating the `Autoinsert closing characters` check box. If you only want to exclude some of the characters from being inserted automatically, activate the `Autoinsert closing characters` check box and deactivate the corresponding check box for the respective character. If you insert an opening character for which autoinsertion is enabled, the corresponding closing character is automatically inserted and the cursor is placed between the two characters.

When inserting comment marks, please note that you have to highlight a text section before entering a `"/` or `--` in order to comment out this text. DatabaseSpy will then automatically insert a `/*` after the `/` in front of the text as well as `*/` after the text if you enter a `/`, or add a second `--` if you enter a `--` while the text to be commented out is selected.

Behaviour

When the corresponding option is activated, the closing character is deleted automatically when the opening character is deleted in the SQL Editor.

To place selected text inside a pair of autoinserted characters, activate the `Wrap selected text when autoinserting` check box and then type the opening character. The opening and closing characters are inserted automatically before and after the text.

Star Expansion

DatabaseSpy can automatically replace the `/*` in a `SELECT * FROM ...` statement with all of the columns of the respective table if the `Expand columns with tab` option is checked.

Please note that the statement has to be valid and that you must place the cursor behind the `/*` in the statement and then hit the **Tab** key to achieve this.

17.2.5 Result View

The Result View section of the **Options** dialog box lets you configure aspects of the appearance of the Result window in the SQL Editor.

The screenshot shows the 'SQL Editor: Result View' dialog box. It has a title bar with a grid icon and a 'Reset to Page Defaults' button. The dialog is divided into three sections: 'Colors', 'Display Options', and 'Data Editing'. In the 'Colors' section, there is a checked checkbox for 'Show grid with alternating colors' and a color selection box. The 'Display Options' section contains five checked checkboxes: 'Show horizontal lines', 'Show vertical lines', 'Show line numbers', 'Show result toolbar', and 'Show sorting arrows'. The 'Data Editing' section contains four checkboxes: 'Use transactions to save changes' (checked), 'Rollback transactions on failure' (checked), 'Initialize cells with default values' (unchecked), and 'Show hint when data editing is limited' (checked).

Colors

You can have rows in Result tabs displayed as simple grid or with alternating white and colored rows. The color can be changed using the color chooser below the check box.

Display Options

By default, horizontal and vertical grid lines as well as line numbers and the **Result** toolbar are displayed. You can switch any of these options off by deactivating the respective check box.

DatabaseSpy allows you to sort data contained in the result grid either ascending or descending by repeatedly clicking the column headers. To enable this option, activate the `Show sorting arrows` check box.

Data Editing

When the default setting is applied, DatabaseSpy uses transactions to save changes in the result grid and rolls back these changes if a failure occurs during committing the changes to the database. Any editing is then written into a transaction which is executed as a whole. If the `Rollback transactions on failure` check box is activated, all changes contained are undone upon failure of a single update statement in the transaction.

Please note that transactions are not supported by MS Access databases

If default values are defined for the individual database fields, DatabaseSpy can automatically insert these values when creating a new line in the result grid. Deactivate the `Initialize cells with default values` check box if you want to create empty lines.

When data editing is not possible to the full extent, DatabaseSpy shows a warning message before the data is displayed in the Result window. You can suppress this hint by deactivating the `Show hint when data editing is limited` check box.

17.2.6 Fonts

The Fonts section of the **Options** dialog box lets you configure color and font settings of different parts of SQL statements. Use the drop-down list below the heading of the dialog page to switch between Text Editor and Result View settings.

Text Editor Font

The screenshot shows the 'SQL Editor: Fonts' dialog box. On the left, a list of SQL elements is shown: Default, Comment, Number, String, Operator, Identifier, Variable, Statement, Datatype, Global Variable, and Function. The 'Text Editor Font' dropdown is set to 'Default'. On the right, the 'Font face' is 'Courier New', 'Size' is '10', and 'Styles' are 'B', 'I', 'U', and 'A'. The 'Use the same for all' checkboxes are checked for both font face and size. A 'Reset to Page Defaults' button is in the top right.

The types listed in the left hand pane are elements of SQL statements. You can choose the common font face, style, and size of all text that appears in SQL Editor. Note that the same font and size is used for all text types. Only the style can be changed for individual text types. This enables the syntax coloring feature.

Click the **Reset to Page Defaults** button to restore the original settings.

Result View Font

The screenshot shows the 'SQL Editor: Fonts' dialog box for 'Result View Font'. The left pane shows 'Header' and 'Data'. The 'Result View Font' dropdown is set to 'Header'. On the right, the 'Font face' is 'Arial', 'Size' is '8', and 'Styles' are 'B', 'I', 'U', and 'A'. The 'Use the same for all' checkboxes are unchecked for both font face and size. A 'Reset to Page Defaults' button is in the top right.

In the left hand pane, you can choose either the result grid header or the data rows. You can choose the common font face, style, and size of all text that appears in the result grid. Note that you can apply the same font and/or size to all text types by activating the respective *Use the same for all* check box.

Click the **Reset to Page Defaults** button to restore the original settings.

17.3 Design Editor Options

The main page of the Design Editor options defines the visual appearance and general behaviour of the editor. Additional Design Editor-related settings are defined in the [Element Colors](#) and [Fonts](#) options.

Design Editor [Reset to Page Defaults]

General Behavior

- ☐ Automatically connect data source
- ☐ Automatically expand newly created objects
- ☐ Show drag and drop tooltips

Tables

- ☐ Automatically create primary key for new tables
- ☒ Show schema name in header

Relations

- ☐ Hide labels of unselected lines
- ☒ Highlight active relations objects

Default options on insertion

- ☐ Insert with compact layout (single column)
- ☒ Expand table object when inserted

Grid settings

- ☒ Snap to grid
- Adjust the grid size:

General Behavior

If you have several data sources defined in your project but not all are active, you can automatically connect to the related data source when you open a design file in Design Editor. A prompt asking you if you want to connect will appear if this option is not activated. DatabaseSpy can display tooltips when database objects are dragged from the Online Browser or from different table designs into the Columns or Keys section of a table design. When creating new database objects, you can automatically display the properties box in the Design Editor so as to fine-tune the definition of the objects without having to change to the properties window. For this purpose, activate the `Automatically expand newly created objects` check box.

Tables

When new tables are created in the Design Editor, DatabaseSpy can automatically create primary keys for them. The first column of a new table is then renamed to "id" and a primary key constraint is added to the Keys section. You can have the schema name displayed in parentheses in the title bar of a table.

Relations

By default, all connection lines between related tables are labeled in Design Editor. You can, however, hide the labels of unselected lines by deactivating the respective check box. Highlighting active relations objects will gray out tables that do not form part of a relation when you click on the line that connects related tables.

Default options on insertion

The default table layout can be set to [compact](#) and/or expanded. In the compact layout only the column names of a table are visible (check the `Insert with compact layout (single column)` check box to switch to compact layout). If the `Expand table object when inserted` check box is not checked, only the title bar of a table will be displayed.

Grid Settings

Adjust the grid size according to your needs and specify whether or not database objects in the Design Editor should snap to grid.

17.3.1 Element Colors

The Colors section of the **Options** dialog box lets you configure colors for objects in the Design Editor.

Element Colors

Specify the color that is used for displaying each element in the Properties windows. Select an element from the list and choose a color for it from the drop-down list. Click the **Reset All** button to restore the original settings.

Selection Colors

Define the colors for selected elements and text. Click the **Reset All** button to restore the original settings.

Background Coloring

Defines the appearance of Design Editor's background. Choose between solid and gradient background and specify the colors and the way they are used in the gradient.

17.3.2 Fonts

The Fonts section of the **Options** dialog box lets you configure fonts for objects in the Design Editor.

Font settings

You can choose the font face, size, and style for the individual elements displayed in the Design Editor. Note that, unlike in the Text Font section, it is possible to specify different font faces for header and data rows. To apply the same font and/or size to all text types, activate the respective *Use the same for all* check box.

The element names in the list box are defined as follows:

- **Title:** The name of a table in its title bar
- **Data:** The content of the table, i.e., the column names
- **Compartment:** The sub-titles in a table, i.e., Column Name, Indexes, Keys, Check Constraints
- **Label:** The designation of the connection line which links related tables in the Design Editor
- **Note:** The content of sticky notes that you add to the design view

17.4 Data Compare Options

The main page of the Data Compare Options defines how the compared tables in data and schema comparisons are displayed in the comparison components and whether tables and/or columns should be mapped automatically when added to a comparison. Additional settings related to database data comparison are defined on the [Comparison Options](#), [XML Compare](#), and [Result View](#) pages.

Data Compare Reset to Page Defaults

Display Options

- ☒ Show table selection for new documents
- ☒ Show tables initially expanded
- ☒ Show schema name
- ☒ Show data source name in header

Automatic table and column mapping

- ☒ Map tables automatically
- ☒ Map columns automatically
 - ☒ Find mapping by name
 - ☐ Find mapping by type
 - ☐ Find mapping by name and type
 - ☐ Find mapping based on column positions
- ☒ Ignore case when mapping tables
- ☒ Exact match when mapping tables
- ☐ Ignore binary data columns
- ☐ Ignore XML columns
- ☐ Ignore identity columns
- ☐ Ignore calculated columns
- ☐ Ignore case when mapping by name
- ☒ Exact match when mapping by name

Schema comparison

- ☐ Try to map unconnected items during comparison

Display Options

In order to be able to open a comparison window without having to specify data source and tables to be compared, deactivate the `Show table selection for new documents` check box. If you prefer that all tables be shown with the columns not expanded, deactivate the `Show tables initially expanded` check box. You can deactivate the display of the schema name for tables in components, and show the data source name in the component header.

Automatic table and column mapping

When tables are added to a comparison, they are automatically mapped. You can deactivate the automatic mapping of columns and/or tables and choose how (i.e., by name, by type, by name and type, or based on ordinal position) they should be mapped. In addition, you can specify whether or not binary data columns, XML columns, identity columns, calculated columns, or the case of a column name should be ignored. If you want to map item names that match to a large extent but are not exactly equal (e.g. "expenses2008" and "expenses_09"), deactivate the `Exact match when mapping by name` check box.

Schema comparison

If you activate the `Try to map unconnected items during comparison` check box, DatabaseSpy will try to find corresponding items for unmapped items in the opposite component when a comparison is started.

17.4.1 Comparison Options

The Comparison Options section of the **Options** dialog box displays the options that are used for string-based comparison.

Comparison Mode

You can choose from among two comparison modes: The native type considers the data type of the column that is compared, whereas everything will be converted into strings before comparison if you use the string representation type.

Comparison Options

Deactivate the `Ignore case in comparison` check box if upper and lower casing should not be ignored when checking for differences.

Check the `Ignore whitespaces in comparison` option if you do not want to consider whitespaces when comparing database data. Whitespace characters are space, tab, carriage return, and line feed.

If you do not want to make a difference between an empty field and a field containing the NULL value, activate the `Treat [ NULL ] as empty string` check box.

Numeric Options

Floating point numbers can be filled up with trailing zeros by activating the `Append trailing zeros to floating point numbers` check box.

Optimization Options

If you do not care to see rows that are equal in both tables of a comparison, you can check the `Keep only different rows in memory` option. In this case, only different rows are retrieved and displayed in the Result window.

Execution Options

You can define whether you want to process comparison of multiple tables sequentially or parallel. Changes can be committed with or without the use of transactions and you can decide whether or not you want to rollback on errors.

17.4.2 XML Compare

The XML section of the **Options** dialog box displays the options that are used for XML-based comparison.

Whitespaces

Whitespace characters are space, tab, carriage return, and line feed. The three options here compare files with whitespace unchanged; with whitespace normalized (i.e., all consecutive whitespace characters are reduced to one whitespace character); and with all whitespace stripped (i.e., not considered for comparison).

Case sensitivity

If the `Ignore case` check box is checked, then case is ignored, and you have the option of ignoring or not ignoring case in node names.

Namespace/Prefix

These are options for ignoring namespaces and prefixes when searching for differences.

Ignore node types

Check the node types that will **not** be compared in the Compare session. Node types that may be ignored are Attributes, CDATA, Comments, Processing Instructions, DOCTYPE statements, and XML declarations.

Order

If `Ignore order of child nodes` is selected, then the relative position of the child nodes of an element is ignored. As long as an element node with the same name exists in each of the two sets of sibling nodes, the two sets are considered to be equal. Note, however, that if an element node has an attribute, it will always be considered unequal to an element with the same name in the compared sibling set—even if the `Ignore order of child nodes` is selected. The option of ignoring the order of attributes is also available, and applies to the order of attributes of a single element.

Entities

If `Resolve entities` is selected, then all entities in the document are resolved. Otherwise the files are compared with the entities as is.

Text

If `Ignore text` is selected, then differences in corresponding text nodes are not reported.

Depth

If `Ignore node depth` is selected, then the additional depth of any element (i.e., more levels of descendants) relative to the depth of the corresponding element in the compared file is ignored. This option must be unselected to enable merging and exporting differences.

17.4.3 Result View

The Compare Result View section of the **Options** dialog box provides options for customizing the display of the comparison results.

**Display Options**

Activate the relevant check boxes if you want to display horizontal or vertical lines, or line numbers in the Compare Result View. You can also adapt the default gutter width if you want to separate the compared columns from each other more clearly.

Advanced Selection Options

When checked, the `Don't auto-select relevant cells` check box allows you to select a single cell containing a difference in the result grid without automatically selecting the corresponding cell in the compared table. Leaving the check box unchecked (default setting) the two different cells are always selected as a pair so as to show you exactly which cells will be affected by a merge.

Chapter 18

User Reference

18 User Reference

18.1 Tables

All the information stored in a database is contained in tables. In DatabaseSpy, you have two options for creating a new table: you can (i) [copy an existing table](#) with few mouse clicks by generating and executing the required SQL statements in the SQL Editor, or (ii) use the Design Editor to [create a table from scratch](#) or [duplicate columns](#) of an existing table.

Tables can be viewed in the Online Browser or dragged into a Design Editor window.

18.1.1 Creating Tables

Once you are connected to a data source, you can create a new table in DatabaseSpy in several ways.

- Open an SQL Editor window, enter the required SQL statement (*see example for SQL Server below*), and click the **Execute**  button in the SQL Editor toolbar.

```
CREATE TABLE newTable (
    id INT NOT NULL,
    CONSTRAINT PK_newKey PRIMARY KEY (id)
)
```

You must define at least one column for the new table. Additional columns can be included immediately when the table is created, or added later using drag and drop in the SQL Editor or the Design Editor.

- Open a Design Editor window, click the **New Table**  button in the Design Editor toolbar (or select the menu option **Design Editor | Create New Table**), edit the default properties as required, and click the **Execute Change Script**  button in the Database Structure Change Script window.

The above screenshot depicts the same example in a DB2 database. The Database Structure Change Script window displays the corresponding change script if the currently used schema in the database is "USER".

After you have executed either the SQL statement you have entered in the SQL Editor or the change script that is automatically generated when adding a table in the Design editor, you can conveniently add additional [columns](#), [keys](#), [indexes](#), and constraints in the Design Editor, duplicate existing columns from other tables, or [create foreign key relationships](#) by dragging a key or index from the Online Browser into a table design.

18.1.2 Duplicating Tables

If you want to re-use the definition of a table that is already present in DatabaseSpy, all you have to do is to display the corresponding CREATE statement in an SQL Editor window, edit it as required, and execute the script. This way, you can even duplicate tables from different databases, provided that you edit the SQL statements so as to comply with the syntax of the target database.

Alternatively, you can also use DatabaseSpy's [table structure converting feature](#).

To duplicate a table definition:

1. Right-click a table in the Online Browser and select **Show in new SQL Editor | Create** from the context menu.
2. Rename the table in the SQL Editor if you want to add the duplicate to the same database.
3. Optionally, edit the column and key properties.
4. If you want to add the table to a different database, change the execution target in the execution target bar.
5. Optionally, edit the SQL syntax to comply with the target database.
6. Click the **Execute**  button in the SQL Editor toolbar.

18.1.3 Modifying Column Properties

When a column is selected either in the Online Browser or in a Design Editor window, its properties are displayed in DatabaseSpy's Properties window. In addition, you can [show some of the properties](#) (data type, nullability, default value, description, identity, increment, and seed) directly in the Design Editor.

Data type

When you need to change the data type of a column, you can edit the `Type` field directly in the table design. DatabaseSpy assists you by displaying incomplete data type entries in gray and changing the color to black as soon as you have typed in a valid keyword. While you are typing, a drop-down list containing the available data types is displayed. Incorrect syntax is marked in red. For data types requiring a length, you can also type in "max" and thus set the length to the maximum allowed value.

Nullability

The `Nullable` check box can also be changed directly in the table design. Please note that NULL values are not permitted if a primary key is defined on that particular column and that you cannot deactivate the `Nullable` check box if NULL values are already present in the column.

Data length

Every data type has a default length defined that is automatically used when you select that particular data type. For some data types, you can increase or decrease this default length in the Properties window. Please consider that existing values may be truncated if you decrease the data length in an existing table.

Precision

In numeric columns, you can define the maximum number of digits to be used by a data type.

Scale

The Scale property defines the maximum number of digits to the right of the decimal point in numeric and decimal columns.

Description

You can add an individual description for each of the columns.

18.1.4 Designing Tables

Once you have created a table in DatabaseSpy, you have several options for designing the table. You can always use the SQL Editor and write and execute the respective SQL statements to change the design of a table, however, DatabaseSpy's Design Editor provides a series of more convenient options for adding [columns](#), [primary](#), [unique](#), and [foreign](#) keys, [indexes](#), as well as [check](#) and [default](#) constraints, or defining [identifier](#) columns.

- [Drag and Drop](#)
- [Context menu options](#)
- **Create new Object**  [button](#)
- [Menu commands](#)
- [Keyboard shortcuts](#)

Drag and Drop

In the Design Editor, you can use drag and drop in two ways:

- Select a table, column, or primary key in the Online Browser and drop it onto a table design of another table.
- Select a table in the Online Browser and drag it into the Columns section of the table design of a different table to create duplicates of all columns in the target table. Note

that only the columns of the source table will be duplicated; to duplicate the table in its entirety, use the [context menu in the Online Browser](#). You can also select one or more individual columns in the Online Browser or a table design in the Design Editor and drag the column(s) into a (different) table design.

Context menu options

Depending on where the cursor is located in a table design when the right mouse button is pressed, two different context menus are provided for creating database objects.

Right-clicking the table header or into any of the Keys, Indexes, or Constraints sections will pop up the context menu depicted above.

If you right-click a column in the Columns section of a table design, the right context menu will be displayed and you can directly define an index, keys, or a default constraint on the selected column.

Create new Object button

Each section in a table design provides a **Create new Object**  button for adding new database objects to a table. Clicking this button will immediately add a new column or check constraint, or pop up a menu where you can choose the type of key or index you want to define.

Menu commands

The command for adding new columns is also available in the **Design Editor** menu. Select the menu option **Design Editor | Create New Column** to add a new column to the active table design in the Design Editor.

Keyboard shortcuts

DatabaseSpy provides also the keyboard shortcut **Alt+C** for adding new columns in the Design Editor.

Adding Columns

DatabaseSpy provides different methods for adding columns to a table: you can either define a new column from scratch in the Design Editor, or re-use an existing column definition from a different table.

To create a new column from scratch:

1. In the Design Editor, do one of the following:
 - Select the table and choose the menu option **Design Editor | Create New Column**.
 - Press **Alt+C**.
 - Right-click the table and select **Insert new | Column** from the context menu.
 - Click the plus  icon to the right of the last column name.

The column is inserted into the table and shows a New  icon to the left of the column name which is highlighted for editing.

2. Enter a descriptive name for the column and press **Enter**.
The SQL statement in the Database Structure Change Script window is updated.
3. Optionally, repeat steps 1 and 2 to insert additional columns.
4. Modify the column properties as required.
5. Optionally, change the column order by right-clicking a column and selecting **Move Column Up** or **Move Column Down** from the context menu.
6. Execute the change script.

Re-using existing column definitions

Two options in DatabaseSpy allow you to add columns to a table that are based on existing columns in another table: (1) You can generate an SQL statement that adds the selected columns to a table. By default, the table from which the columns originate is included in the statement and has to be edited so as to add the columns to a different table. (2) When the target table has already been created and is displayed as table design in a Design Editor window, you can drag one or several columns from the Online Browser or from a different table design and drop the column(s) onto the Columns section of the target table. You can even drag an entire table from the Online Browser, this will add all columns of the source table to the target table.

To duplicate columns from other tables:

1. Select the column to be duplicated in the Online Browser or in the Design Editor and, keeping the mouse button pressed, drag it into the Columns section of the table design where you wish to add the column.
2. Optionally, edit the column properties and/or the column name.
3. Execute the change script.

To generate SQL for creating a column using an existing column definition:

1. In the Online Browser, right-click the column that serves as a model for the new column to be created.
2. Select the menu option **Show in new SQL Editor | Add** from the context menu.
3. In the SQL Editor, change the column name and edit the column definition, if required.
4. Click the **Execute**  button or press **F5**.

Deleting Columns

Several options are available for deleting an individual column, or several columns in bulk. To delete more than one column in one step, select the columns in the Online Browser or Design Editor while keeping the **Ctrl** key pressed (**Ctrl-Click**).

To delete a column from a table:

1. Do one of the following:
 - In the Online Browser, right-click a column and choose **Delete** from the context menu or press **Del**.
 - In the Design Editor, right-click and choose **Delete selected Columns** from the context menu or press **Shift+Del**.

A change script is generated and the column is marked for deletion .

- In the Online Browser, right-click a column and select **Show in new SQL Editor | Drop** from the context menu.

A DROP statement is generated in a new SQL Editor window.

2. Depending on your choice in step 1, do one of the following:
 - In the Database Structure Change Script window, click the **Execute Change Script**  button.
 - In the SQL Editor, click the **Execute**  button or press **F5**.

Defining a Primary Key

By default, when [creating a new table](#) in DatabaseSpy's Design Editor, a primary key will automatically be defined on the first column. This option can, however, be disabled in the [Design Editor Options](#), you will then have to define a primary key manually. Also, if a table has been created by executing the relevant SQL statements, no primary key may be defined when you show a table in a Design Editor window. There are four ways to define a primary key in the Design Editor:

- Selecting the **Make Primary key** command from the context menu of a column in a table design
- Dragging a column from the Online Browser and dropping it onto the Keys section of a table design
- Clicking the **Create new Key Constraint**  icon in the Keys section of a table design
- Right-clicking anywhere into the table design and selecting **Insert new | Key | Primary Key** from the context menu

In addition, you can always enter and execute the appropriate SQL statement in an SQL Editor window.

The easiest way to define a primary key constraint in DatabaseSpy is to select the respective column(s) in a table design and use the **Make Primary Key** command from the context menu.

Alternatively, you can drag a column from the Online Browser into the Keys section of a table design and select **Create Primary Key** from the menu that pops up. This menu is also displayed if you click the **Create new Key Constraint** icon in the Keys section of the table design.

While the dragged column is automatically inserted into the Columns column, you have to double-click the Columns column and select a primary key column from the drop-down list if you use the **Create new Key Constraint** icon for adding the primary key or right-click anywhere into the table design and select **Insert new | Key | Primary Key** from the context menu.

DatabaseSpy checks the nullability of a column on which a primary key is defined. If you select a nullable column for a primary key, a dialog box will be displayed where you can clear the `Nullable` check box. If you try to define a primary key for a table containing only nullable columns, DatabaseSpy displays a warning message. Click **OK** and deactivate the `Nullable` check box in the primary key column.

As always when making changes to the database structure, a change script is generated which must be executed in order to actually create the primary key in the database.

To define a primary key in the Design Editor:

Do one of the following:

- Select the column(s) you want to include in your primary key, right-click and select **Make Primary Key** from the context menu.
- In the Online Browser, select and, keeping the mouse button pressed, drag one or more columns into the Keys section. Release the mouse button and select **Create Primary Key** from the menu that pops up.

A new primary key is added, and the prefix `PK_` is inserted into the Keys section and highlighted for editing. Enter a descriptive name and press **Enter**. The selected column(s) appear(s) in the Columns column.

- Right-click into the table design and select **Insert new | Key | Primary Key** from the context menu. Alternatively, expand the Keys section by clicking the triangle at the right edge of the section header, click the **Create new Key Constraint**  icon at the bottom of the Key column and select **Create Primary Key** from the menu that pops up.

A new primary key is added, and the prefix `PK_` is inserted into the Keys section and highlighted for editing. Enter a descriptive name and press **Enter**.

Double-click the Columns column or click the **Add Column to Key**  button and choose a column from the drop-down list that opens. Keep in mind that this column must not be nullable! If you choose a nullable column for a primary key, DatabaseSpy displays an information box and suggests to make that column non-nullable.

Optionally, if the primary key is to span more than one column, click the **Add Column to Key**  icon in the Columns column of the Keys section and select an additional column from the drop-down list. Repeat for additional columns, if required. Each

column that forms part of the primary key is marked with the primary key  icon in the Design Editor as well as in the Online Browser.

Viewing and Modifying Primary Keys

After you have executed the change script, the primary key  icon for columns is displayed to the left of the column name in the Columns folder of the Online Browser and when you show the table in the Design Editor. In the Online Browser, the name of the primary key constraint will also show up in the Keys sub-folder of the respective table and will be marked with the primary key  icon.

In the Online Browser, the column definition can be viewed in detail by expanding the primary key entry in the Keys folder.

In the Design Editor, the column the primary key is assigned to is displayed in bold when you select the primary key constraint in the Keys section.

Modifying a primary key constraint

You can rename, delete or change the definition of a primary key constraint. Note that the primary key constraint is always deleted first and then recreated with the new definition. The

respective SQL statement is generated automatically in the Database Structure Change Script window if you modify the primary key definition in the Design Editor. A primary key cannot be deleted if it is referenced by a [foreign key](#) in another table.

Defining and Modifying Unique Keys

When defining a unique key for a table, please consider that if the unique key constraint is applied to an existing column, this column must not contain duplicate values. The column may be nullable, however the NULL value can occur only once.

There are four ways to define a unique key in the Design Editor; basically the procedures are the same as described for [primary keys](#) are used:

- Selecting the **Make Unique key** command from the context menu of a column in a table design
- Dragging a column from the Online Browser and dropping it onto the Keys section of a table design
- Clicking the **Create new Key Constraint**  icon in the Keys section of a table design
- Right-clicking anywhere into the table design and selecting **Insert new | Key | Unique Key** from the context menu

In addition, you can always enter and execute the appropriate SQL statement in an SQL Editor window.

As always when making changes to the database structure, a change script is generated which must be executed in order to actually create the unique key in the database. DatabaseSpy performs a check as to whether the content in the constrained column is unique. If the check fails, a message box listing the duplicate values pops up.

Columns that have a unique key assigned are marked with the unique key  icon in the Design Editor and the Online Browser.

To define a unique key in the Design Editor:

Do one of the following:

- Select the column(s) you want to include in your unique key, right-click and select **Make Unique Key** from the context menu.
- In the Online Browser, select the column(s) you want to include in your unique key, drag the column(s) into the Keys section of the table design, and select **Create Unique Key** from the popup menu that appears.

A new unique key is added, and the prefix UK_ is inserted into the Keys section and highlighted for editing. Enter a descriptive name and press **Enter**. The selected column(s) appear(s) in the Columns column.

- Right-click into the table and select **Insert new | Key | Unique Key** from the context menu.
- Expand the Keys section by clicking the triangle at the right edge of the section header and click the **Create New Key Constraint**  icon in the Key column and select **Create Unique Key** from the menu that pops up.

A new unique key is added, and the prefix UK_ is inserted into the Keys section and highlighted for editing. Enter a descriptive name and press **Enter**.

Double-click the Columns column or click the **Add Column to Key**  button and choose a column from the drop-down list that opens.

Optionally, if the unique key is to span more than one column, click the **Add Column to Key**  icon in the Columns column of the Keys section and select an additional column from the drop-down list. Repeat for additional columns, if required.

Each column that forms part of the primary key is marked with the primary key  icon in the Design Editor as well as in the Online Browser.

Viewing unique key constraints

After you have executed the change script, the unique key  icon is displayed to the left of the column name in the Columns folder of the Online Browser and when you show the table in the Design Editor. In the Online Browser, the name of the unique key constraint will also show up in the Keys sub-folder of the respective table and will be marked with the unique key  icon.

In the Online Browser, the column definition can be viewed in detail by expanding the unique key entry in the Keys folder.

In the Design Editor, the column the unique key is assigned to is displayed in bold when you select the unique key constraint in the Keys section.

Modifying a unique key constraint

You can rename, delete or change the definition of a unique key constraint. Note that the

unique key constraint is always deleted first and then recreated with the new definition. The respective SQL statement is generated automatically in the Database Structure Change Script window if you modify the unique key definition in the Design Editor. A unique key cannot be deleted if it is referenced by a [foreign key](#) in another table.

Defining Foreign Keys

A foreign key constraint can reference a column in another table if this column has (i) a [primary key constraint](#), (ii) a [unique key constraint](#), or (iii) in SQL Server, a [unique index](#) defined on it. The column that is referenced by the foreign key in the other table has to be of same data type and length as the referencing column.

The easiest way to define a foreign key in DatabaseSpy is to select (i) a primary or unique key constraint, or a unique index (in SQL Server), or (ii) the column on which a primary or unique key, or a unique index, respectively, is defined in the Online Browser and drag it into the Keys section of the referencing table design in the Design Editor. This will create a foreign key on the first column that has the same data type as the column that is referenced by the dragged key or index, respectively. You can now rename the foreign key or assign it to a different column.

In addition, there are three ways to define a foreign key in the Design Editor which basically use the same procedures as described for [primary keys](#):

- Dragging a column from the Online Browser and dropping it onto the Keys section of a table design
- Clicking the **Create new Key Constraint** icon in the Keys section of a table design
- Right-clicking anywhere into the table design and selecting **Insert new | Key | Foreign Key** from the context menu

As always when making changes to the database structure, a change script is generated which must be executed in order to actually create the foreign key in the database.

To define a foreign key in the Design Editor:

1. Do one of the following:

- Select a primary key, unique key, or unique index in the Online Browser and drag it into the Keys section of the referencing table.
- Right-click into the table and select **Insert new | Key | Foreign Key** from the context menu.
- Expand the Keys section by clicking the triangle at the right edge of the section header, click the **Create New Key Constraint**  icon in the Key column and select **Create Foreign Key** from the menu that pops up.

A new foreign key is added, and the prefix `FK_` is inserted into the Keys section and highlighted for editing.

2. Enter a descriptive name and press **Enter**.
3. Optionally, click the **Autosize**  icon to display the content of the Reference column.
4. If applicable, double-click the "[select the referenced table]" entry and select a table from the drop-down list that appears. The first column in that table that may be referenced by a foreign key (i.e., the column must have a primary key, a unique key, or—only with SQL Server—a unique index defined) is displayed below the table name. Note that the appropriate column is inserted automatically if you have dragged a key from another table.
5. If applicable, double-click the column name and select a different column from the drop-down list that appears.
6. In the Columns column, the first column in the table is automatically inserted. To edit this entry, double-click the column name and select the appropriate column from the drop-down list that appears.

Duplicating foreign keys

If you want to duplicate an existing foreign key, you can also use the context menu in the Online Browser to generate an SQL statement that adds a foreign key constraint to the table.

To duplicate an existing foreign key:

1. In the Online Browser, expand the Keys folder of the table that contains the foreign key you want to duplicate and right-click the foreign key.
2. Select **Show in new SQL Editor | Add** from the context menu.
3. In the SQL Editor, edit table name, column name, as well as the name of the foreign key as required.
4. Click the **Execute**  button to execute the SQL statement and create the new foreign key.

Cross-schema references

Foreign keys can also reference a column in a table that is located in a different schema. When defining this reference using the Design Editor, tables in the same schema are printed black, whereas tables located in a different schema are printed blue in the drop-down list that opens when you double-click a table name in the Reference column of a table design.

Viewing and Modifying Foreign Keys

After you have executed the change script, the foreign key  icon for columns is displayed to the left of the column name in the Columns folder of the Online Browser and when you show the table in the Design Editor. In the Online Browser, the name of the foreign key constraint will also show up in the Keys sub-folder of the respective table and will be marked with the foreign key  icon.

In the Online Browser, the column definition can be viewed in detail by expanding the foreign key entry in the Keys folder.

In the Design Editor, the column the foreign key is assigned to is displayed in bold when you select the foreign key constraint in the Keys section.

You can also display the referenced table in the Design Editor window. Right-click the table design and select **Add related tables | Referenced Tables** from the context menu. The table that is referenced by the foreign key constraint is added to the design. Click the connector line or the label to indicate all keys and columns that are involved in the foreign key relation.

Modifying a foreign key constraint

You can rename, delete or change the definition of a foreign key constraint. Note that the foreign key constraint is always deleted first and then recreated with the new definition. The respective SQL statement is generated automatically in the Database Structure Change Script window if you modify the foreign key definition in the Design Editor.

Defining and Modifying Check Constraints

Check constraints can be defined both on table and on column level and make sure that only valid data is entered into a specific column of a table. If the condition is not met, the respective column cannot be updated and new rows cannot be added (*see screenshot below*). DatabaseSpy outputs a corresponding message in the Message tab.

As always when making changes to the database structure, a change script is generated which must be executed in order to actually create the check constraint in the database. DatabaseSpy performs a validation of the expression that will be used for the check constraint. While you are defining a check constraint in the Design Editor, the Database Structure Change Script window displays comments if the expression is invalid.

```
-- region adding check constraints
-- Error: missing expression for check constraint CK_1.
-- ALTER TABLE [ZooDB].[dbo].[table1] ADD CONSTRAINT [CK_1] CHECK ( )
-- endregion adding check constraints
```

The following issues are validated and corresponding messages are displayed in the change script:

- Missing expression
- Invalid identifier
- Textual or numeric constant not matching column data type
- Column data types not matching
- Invalid expression
- "IS NOT NULL" clause applied to a nullable column

To define a check constraint in the Design Editor:

1. Do one of the following:
 - Right-click into the table and select **Insert new | Check Constraint** from the context menu.
 - Expand the Check Constraints section by clicking the triangle at the right edge of the section header and click the **Create new Check Constraint**  icon in the Check Constraint column.

A new check constraint is added, and the prefix `CK_1` is inserted into the Check Constraints section and highlighted for editing.
2. Enter a descriptive name and press **Enter**.
3. In the Expression column, enter the expression that is to be checked when data is committed to the database and press **Enter**.

Viewing check constraints

In the Design Editor, check constraints on table level are displayed in a separate section where they can be edited and where you can add additional or delete unneeded check constraints.

Columns that have a check constraint assigned are marked with the check constraint  icon in the Design Editor and the Online Browser. Check constraints on column level can be edited in the Properties window of the column to which they are applied. Please note that they do not show up in the Check Constraints section of the table! To see the name and definition of this column's constraint, you have to display the column properties in the Properties window.

In the Online Browser, check constraints appear in the constraints sub-folder of the table or column, depending on whether the constraint has been defined on table or column level.

Check constraints on table level (*above screenshot*) appear in the Constraints folder of the table they are assigned to.

Check constraints on column level (*right screenshot*) are displayed under the Constraints folder of the column. Note that no Constraints folder on table level is available in this case.

Modifying check constraints

You can rename, delete or change the expression of a check constraint. Note that the check constraint is always deleted first and then recreated with the new definition. The respective SQL statement is generated automatically in the Database Structure Change Script window if you modify the check definition in the Design Editor.

When you rename a column that is used in a check constraint expression, DatabaseSpy automatically updates the check constraint in the change script that is used to rename that column.

If a column is deleted, any check constraints that reference this column are dropped as well.

Adding check constraints using SQL

If check constraints already exist in a table, you can add new constraints to the table also by right-clicking an existing check constraint and generating a statement that uses the properties of the existing item as default. After editing the properties as required and executing the SQL, a new check constraint is added to the database.

To add a check constraint to a table using SQL:

1. Connect to the database and show the respective data source in the Online Browser.
2. Expand the table to which you want to add a check constraint and right-click an existing constraint in the Constraints folder.
3. Select **Show in new SQL Editor | Add** from the context menu or, holding down the right mouse button, drag the constraint into an open SQL Editor window and choose **Add** from the popup.
An ALTER TABLE statement is generated in the SQL Editor window.
4. Edit the statement as follows:
 1. Enter the path of the table that is to be checked after the ALTER TABLE part of the statement.
 2. Type the name of the new constraint after the ADD CONSTRAINT part of the statement.
 3. Edit the CHECK (Expression) section; enter the expression that is to be checked when the table is updated.
5. Click the **Execute**  button to execute the statement and to add the new check constraint to the database.
6. In the Online Browser, right-click the database and choose **Refresh** from the context menu.

Defining and Modifying Default Constraints

The table design in the Design Editor provides an option in the context menu to define a standard value for a column. This command inserts the Default field into the column properties where you can then enter the actual standard value for the column.

As always when making changes to the database structure, a change script is generated which must be executed in order to actually create the default constraint in the database.

To define a default value for a column:

1. In the Design Editor, right-click the column for which you want to define a default value and select **Create Default Constraint** from the context menu. In the column properties, the `Default` field is added to the General section and to the table design.
Alternatively, right-click the header of the Columns section in the table design and activate the Default Value column. Double-click that column in the row of the column for which you want to define a default constraint.
2. Enter the default value into the `Default` field (either in the Properties window or directly in the table design).

Viewing default constraints

After you have executed the change script and unless a constraint with a higher [priority](#) has already been defined for that particular column, the default  icon is displayed to the left of the column name in the Columns folder of the Online Browser and when you show the table in the Design Editor.

In the Online Browser, the name of the default constraint, which is composed of the column name plus the "Default_" prefix, shows up in the Constraints sub-folder of the respective column and is marked with the default constraint  icon.

The actual value of the default constraint, that is the default value that will be inserted into the column if a new row is added to the table, can be viewed in the Properties window of the respective column when displayed in the Design Editor.

Modifying default constraints

You can delete a default constraint or change its default value. Note that the default constraint is always deleted first and then recreated with the new value. The respective SQL statement is generated automatically in the Database Structure Change Script window if you change the default value in the Design Editor or in the Properties window.

To change the default value of a column:

1. In the Online Browser, select the column and make sure that its properties are being displayed. Alternatively, display the `Default Value` field in the table design.
2. Edit the default value in the `Default` field of the General section, or in the appropriate row of the Default Value column in the table design, respectively.
3. Execute the change script.

To delete a default constraint:

1. In the Online Browser, select the column and expand its Constraints sub-folder.
2. Right-click the default constraint and select **Delete** from the context menu or select the constraint and press **Del**.
3. Execute the change script.

Creating Identifier Columns

The definition of identifier columns is handled differently in the individual database types.

Microsoft Access

Microsoft Access databases provide a special COUNTER data type that is automatically applied to the column when the `Auto Increment` check box is activated in the Advanced section of the column properties. It is not important which data type is applied to the column when the check box is activated. If the `Nullable` property is checked, a warning is displayed in the Database Structure Change Script window and the `Nullable` property is automatically deactivated when the change script is executed. The initial value of the identity column for the first row to be added is 1, the value will be incremented by 1 for any additional row that you add.

The identifier column of a table can be defined when a new table is created or when a new column is added to an existing table and defined as identity column.

Microsoft SQL Server

In Microsoft SQL Server databases, the `Nullable` check box of a column must be deactivated in order to allow for the `Identity` property to be activated. When the `Identity` check box is activated, two additional fields appear in the Advanced section of the column properties: Enter the initial value that will be inserted into the first row that is created for this table into the `Seed` field, and specify the amount by which this value will be incremented for additional rows in the `Increment` field.

The identifier column of a table can be defined when a new table is created or when a new column is added to an existing table and defined as identity column. The column has to be of data type `int`, `bigint`, `smallint`, `tinyint`, or `decimal` or `numeric` with a scale of 0.

Oracle

Identifier columns not supported.

MySQL

In MySQL databases, the `Nullable` check box of a column must be deactivated in order to allow for the `Auto Increment` property to be activated. The identifier column of a table can be defined when a new table is created and the column has to be of a numeric data type.

IBM DB2

In IBM DB2 databases, the `Nullable` check box of a column must be deactivated in order to allow for the `Identity` property to be activated. When the `Identity` check box is activated, two additional fields appear in the General section of the column properties: Enter the initial value that will be inserted into the first row that is created for this table into the `Seed` field, and specify the amount by which this value will be incremented for additional rows in the `Increment` field.

The identifier column of a table can be defined when a new table is created and the column has to be of data type `INTEGER`, `BIGINT`, `SMALLINT`, or `DECIMAL` or `NUMERIC` with a scale of 0.

Sybase

In Sybase databases, the `Nullable` check box of a column must be deactivated in order to allow for the `Identity` property to be activated.

The identifier column of a table can be defined when a new table is created and the column has to be of data type `int`, `bigint`, `smallint`, `tinyint`, or `decimal` or `numeric` with a scale of 0.

As always when making changes to the database structure, a change script is generated which must be executed in order to actually create the identifier column in the database. DatabaseSpy performs a validation of the column definition that will be used for the identifier column. While

you are defining an identifier column in the Design Editor, the Database Structure Change Script window displays comments if the definition is invalid.

```
-- region creating tables
-- Cannot create identity column that is nullable.
Please revise the attributes of column 'newColumn'.
-- CREATE TABLE [ZooDB].[guest].[newTable] ( [newColumn]
varchar (255)  IDENTITY (1, 1) NULL )
-- endregion creating tables
```

To create an Identifier column:

1. In the Design Editor or in the Online Browser, select the column you want to use as an identity column.
2. In the Properties Window, activate the `Identity` check box or the `Auto Increment` check box, respectively. Alternatively, display the Identity column in the table design and activate the check box for the identity column.
3. Optionally change the default values in the `Seed` (initial value) and `Increment` fields, if applicable.
4. Execute the change script.

18.1.5 Viewing Tables

You can view the structure of any existing table in your database by dragging it from the Online Browser into the Design Editor window or by using the corresponding context menu option. The most important table and [column](#) details are immediately displayed in the Design Editor's graphical view. Additional sections for [indexes](#), [keys](#), and [check constraints](#) can be expanded for the relevant details.

To view a table in a Design Editor window:

- Do one of the following:
 - [Open a new Design Editor window](#) and drag a table from the Online Browser into the window.
 - Right-click a table in the Online Browser and select **Show in new Design Editor** from the context menu.
 - To add a table to an existing Design Editor window, right-click the table in the Online Browser and select **Add to Design Editor** from the context menu.

To auto-size a table:

- In a Design Editor window, click the **Autosize**  icon at the bottom of the table to view all content properly.

To remove a table from a Design Editor window:

- Do one of the following:
 - Right-click the table and select **Remove from Design** from the context menu.
 - Select a table and press **Ctrl+Del**.
 - Select a table and choose the menu option **Design Editor | Remove from Design**.

Please note that removing a table from a design does not delete it from the connected database.

Table layout

You can define the default table layout in the [Design Editor options](#), however you can also change the layout in the Design Editor itself. Apart from the [optimized view](#) which shows the fields `Column Name`, `Type`, and `Nullable` for each column, you can choose two more options for displaying tables in the Design Editor.

The **compact view** shows only the column, index, and constraint names as well as the icons that indicate the constraints that have been defined for a column or the index or constraint type, respectively.

The **collapsed view** shows only the table header.

This view is particularly useful if you want to view all the tables and relations of the entire database and do not need detailed information about the individual tables.

To view a table in the compact view:

- Right-click the table in a Design Editor window and activate **Compact View** in the context menu.

To switch off compact view for a table:

- Right-click the table and deactivate **Compact View** in the context menu.

To collapse or expand a table:

Do one of the following:

- Click the arrow in the upper right corner of a table to toggle between collapsed and expanded view.
- If you want to expand or collapse several tables at a time, select the tables using **Ctrl +Click** and click **Expand selected Tables**  or **Collapse selected Tables** , respectively, in the Design Editor toolbar.

Viewing Table Columns

When you drag a table into a Design Editor window or use the **Show in new Design Editor** command from the context menu of the Online Browser, the table appears in the Design Editor in the optimized view: column name, data type, and the Nullable property are displayed and can be edited directly in the table design.

Column	Type	Nullable
 AnimalTypeID	int	☐
EnglishName	varchar(50)	☐
 LatinName	varchar(50)	☐
AreaOfOrigin	varchar(50)	☐
 Category	int	☐

Indexes (2) 

Keys (3) 

Check Constraints (0) 

Every column that has a special quality, such as, for example, forming part of a relationship, is marked with an icon in front of its name in Design Editor. If a column has more than one constraint assigned, only the constraint with the highest priority is depicted in the column icon. The priority of the constraints is as follows:

Primary key column: This column is used as the table's primary key.

Unique column: This column has a unique constraint defined and therefore accepts only data that is unique in the context of the column.

Referencing column: This column has a foreign key constraint assigned and references the primary key of a different table.

XML column: The data contained in this column are of type XML.

Checked column: This column has a check constraint defined which ensures that only approved values are present in the respective column.

Default value: A default constraint has been defined for this column.

Displaying additional information

When you right-click the header of the table design's Column section, you can select a number of additional properties (Default Value, Description, Identity, Increment, and Seed) to be displayed in the design. Check the properties you want to display in the context menu or select **Show all additional columns**.

Column	Type	Nullable	Default Value	Description	Identity	Increment	Seed
 AnimalTypeID	INT	☐			☐		
EnglishName	TEXT(50)	☐			☐		
LatinName	TEXT(50)	☐			☐		
AreaOfOrigin	TEXT(50)	☐			☐		
 Category	INT	☐			☐		

Indexes (2) 

Keys (2) 

Check Constraints (0) 

Viewing Indexes

When you expand the Indexes section, the table's indexes are displayed in such a way that each column forming part of a particular index is shown in a row of its own and there is a separate column indicating whether it is an ascending or descending index.

Index	Columns	Order
IX_Name	EnglishName	↑
	LatinName	↑
 PK_AnType	AnimalTypeID	↑
UK_LatinName	LatinName	↑

The type of an index is indicated with icons. Non-clustered indexes do not have an icon. The following icons are used:

Clustered index

XML index (available only for columns of type XML)

You can rename an index, change, add, or remove columns, or modify the order directly in the table design. Indexes that have been created automatically for primary or unique keys cannot be modified.

To view the index properties in detail, select an index and view the properties in the Properties window.

Viewing Check Constraints

A check constraint is used to define a range of values that are accepted by a column. It uses a logical expression to determine the acceptable values. Check constraints can be defined on table level (i.e., several columns of a table are checked in the expression) or on a single column. Multiple check constraints can be applied to a single column.

Check constraints **on table level** are shown with an  icon when you expand the Check Constraints section of a table design. They are displayed together with the expression(s) that are used to validate the table.

Check Constraint	Expression
 CK_AgeLimit	([AnimalSex] = 'female' AND [AnimalAge] < 5 OR [AnimalSex] = 'male' AND [AnimalAge] < 8)

Check constraints on table level can be renamed and their expressions can be modified directly in the table design.

A check constraint **on column level** is indicated by the check column  icon being displayed with the column the check constraint is defined for in the Columns section of the table design. Please note that this icon is not displayed if either a primary key, unique key, or foreign key is defined for this column, or if the column is of type XML, since all these qualities are of a higher priority and their corresponding icon will be displayed with the column.

You can edit the expression in the Properties window. To rename a check constraint on column level, right-click the constraint in the Online Browser and select **Rename** from the context menu.

Viewing Key Constraints

When you expand the Keys sections, the key constraints that have been defined for the table are displayed in such a way that each column forming part of a particular key is shown in a row of its own. For foreign keys, there is an additional column where the column that is referenced in another table is displayed.

Key	Columns	Reference
 PK_AnType	AnimalTypeID	
 UK_LatinName	LatinName	
 FK_CategoryID	Category	tblAnimalCategories CategoryID

The type of a key constraint is indicated with icons. The following icons are used:

Primary key: This constraint is the primary key of the table. The primary key ensures that no duplicate data and no NULL values can be inserted into the respective column(s). Only one primary key is allowed in a table.

Unique key: This constraint makes sure that the values entered in a specific column not participating in a primary key are unique. Multiple unique keys can be defined on a table and the NULL value is allowed in the respective table(s). Note, however, that the value NULL can only occur once per column. A unique key can be referenced by a foreign key.

Foreign key: This constraint creates a foreign key relation where the primary or unique key of a table is referenced by a column in a different table. The primary key column or unique key column, respectively, in the first table is used as a foreign key in the referencing column of the second table. This way, the foreign key ensures that only data that is present in the primary or unique key column of the first table can be inserted into the second table.

You can rename a key constraint, change, add, or remove columns, or modify the reference of a foreign key directly in the table design.

To view the properties of a key constraint in detail, select a key constraint and view the properties in the Properties window.

18.1.6 Viewing Relationships Between Tables

When you drag into the Design Editor two or more tables that are related with each other, the relationships between these tables are shown with lines connecting the related tables. DatabaseSpy uses different colors to distinguish the individual relationships:

- **Green:** Self-reference, i.e. the table uses a key that is assigned to one or more of the table's own columns.
- **Blue:** Incoming reference, i.e. the selected table is referenced by a key used in another table.
- **Orange:** Outgoing reference, i.e. the table has a key defined that references one or several column(s) in another table.

Please note that the color of one and the same relation line may change depending on the table that is currently selected. For example, a foreign key relationship is displayed blue if you select the referenced table, and orange if you select the referencing table. The screenshot below shows an incoming relationship for tblAnimalCategories.

The same relationship, however viewed from the referencing `tblAnimalTypes` table's point of view, is depicted with an orange relation line (see screenshot below).

The screenshot below illustrates a self relation that makes sure that the manager number (`MgrNo`) of an employee's manager is contained in the list of employee numbers (`EmpNo`).

18.1.7 Finding Related Tables

In the Design Editor, you can [display the relations](#) between the individual tables. To facilitate this, DatabaseSpy provides an option in the context menu that automatically adds referenced or referencing tables to the active design. You can also save this design in a design file.

You can also define to highlight objects that form part of the currently selected relation in the [Design Editor options](#). In this case, as depicted in the screenshot above, tables that are not part of the selected relation are grayed out. Also note that the referenced columns are printed bold in both tables so that you can view at a glance which columns are related with each other.

To display related tables in the Design Editor:

1. Right-click a table in the Design Editor and select **AddRelated tables** from the context menu.
2. Choose one of the following options from the sub-menu:

- Referenced Tables
- Referencing Tables
- All Relations

The respective tables are added to the Design Editor window.

To highlight objects of the currently selected relation:

1. Make sure that the `Highlight active relations objects` check box is activated in the [Design Editor options](#).
2. Click on a connection line.
The connection line is highlighted and all tables that are not part of this relation are grayed out in the Design Editor window.

18.1.8 Converting Table Structures

Altova web site:  [convert databases](#)

DatabaseSpy allows you to convert the structure of a selected table so as to fit the syntax requirements of a database kind other than the table was initially created in. This can be done either in the Online Browser or the Design Editor by using Drag and Drop. DatabaseSpy creates a change script that must be executed to commit the changes to the database.

The following restrictions apply to the conversion of database tables:

- Properties that would require parsing (e.g., check constraints or triggers) will not be converted
- Foreign keys will not be converted
- Indexes will not be converted

If database items cannot be converted into the target database, a warning message will be displayed in DatabaseSpy.

To convert the structure of a table to a different database type:

1. Open a Design Editor window for the target database.
2. Optionally, display the source table in a Design Editor window of the source database.
3. Select a table in the Online Browser or Design Editor and drag it into the Design Editor window of the target database.
4. Execute the change script.

18.1.9 Indexes

Indexes can make queries of a database considerably faster since only the indexed columns have to be queried. Indexes are created automatically when you define a [primary](#) or [unique](#) key on a column. Where supported by the database, DatabaseSpy allows for the definition of clustered, non-clustered, and XML indexes via a context menu option in the Design Editor. For a more fine-tuned definition of indexes in the individual database kinds, specify the appropriate options in the index properties.

In the Design Editor, indexes can be viewed in a separate section of the table display. Here you see at a glance which columns are included in the index definition, and whether they will be queried in ascending or descending order.

Column	Type	Nullable
AnimalTypeID	int	☐
EnglishName	varchar(50)	☐
LatinName	varchar(50)	☐
AreaOfOrigin	varchar(50)	☐
Category	int	☐

Index	Columns	Order
IX_Name	EnglishName LatinName	↑ ↑
PK_AnType	AnimalTypeID	↑
UK_LatinName	LatinName	↑

Key	Columns	Reference
PK_AnType	AnimalTypeID	
UK_LatinName	LatinName	
FK_CategoryID	Category	tblAnimalCategories CategoryID

Check Constraints (0)

Indexes that have been defined automatically, have the same name as the corresponding primary or unique key. These indexes are displayed in the Indexes section but cannot be modified.

Creating and Modifying Indexes in Design Editor

Depending on the kind of database you are using, different types of indexes can be defined.

Microsoft Access

Only non-clustered indexes can be defined. In the index properties, you can activate the `Enforce Data Validation` check box and select "Primary", "Disallow NULL", or "Ignore NULL" as the preferred method of data validation.

Microsoft SQL Server

Clustered, non-clustered, and—as of SQL Server 2005—XML indexes can be created. Only one clustered index can be defined per table, and will normally be reserved for the primary key. If you create an index on a column of type XML in SQL Server 2005, XML is the only available type of index.

You can change the index type in the General section. To ensure that the indexed data is unique, check the `Unique` property. A unique index can also be referenced by a foreign key.

In the Options section of the index properties, you can activate a number of options. A brief description of the individual option is displayed when you hover over an option with the mouse cursor.

Oracle

Only non-clustered indexes can be defined. In the `Uniqueness` check box, you can choose whether the index should be unique or of type "Bitmap". Please note that unique indexes cannot be referenced by a foreign key in Oracle databases.

In the Options section of the index properties, you can activate a number of options. A brief description of the individual option is displayed when you hover over an option with the mouse cursor.

MySQL

Only non-clustered indexes can be defined. In the General section, you can change the index type to "Regular", "Hashed", or "Full text". To ensure that the indexed data is unique, check the `Unique` property. Please note that unique indexes cannot be referenced by a foreign key in MySQL databases.

■ IBM DB2

Clustered, non-clustered, and XML indexes can be created. Only one clustered index can be defined per table; note that this does not necessarily have to be the primary key column. If you create an index on a column of type XML, XML is the only available type of index.

You can change the index type in the General section. To ensure that the indexed data is unique, check the `Unique` property. Please note that unique indexes cannot be referenced by a foreign key in DB2 databases.

In the Options section you can allow reverse scans, and you can define whether the index should be padded or compressed. Activate the `Collect Statistics` check box, if required, and optionally choose sampled or detailed statistics.

■ Sybase

Clustered and non-clustered indexes can be defined. Only one clustered index can be defined per table. You can change the index type in the General section. To ensure that the indexed data is unique, check the `Unique` property. Please note that unique indexes cannot be referenced by a foreign key in Sybase databases.

In the General section of the index properties, you can define a number of options. A brief description of the individual option is displayed when you hover over an option with the mouse cursor.

■ PostgreSQL

Clustered and non-clustered indexes can be defined. Only one clustered index can be defined per table. You can change the index type in the General section. In the Advanced section, you can change the default access method (which is "B-tree") to "Hash", "GiST", or "GIN". To ensure that the indexed data is unique, check the `Unique` property. Currently, only B-Tree indexes can be declared unique. Please note that unique indexes cannot be referenced by a foreign key in PostgreSQL databases.

To define an index in the Design Editor:

1. Do one of the following:
 - Select the column you want to include in the index definition and press the right mouse button. Select **Make Index** from the context menu.
 - Select the column and, keeping the mouse button pressed, drag it into the Index section.
 - Right-click into the table and select **Insert new | Index** from the context menu.
 - Expand the Index section by clicking the triangle at the right edge of the section header and click the plus symbol .
2. Select the appropriate index type (non-clustered, clustered, or XML index) from the sub-menu that opens. The types of indexes that are available depend on the database kind you are using.

A new index is added, and the prefix `ix_` is inserted into the Index section and highlighted for editing. The first suitable column or the selected column, respectively, is automatically inserted into the Columns column.
3. Optionally, change the index properties in the properties window.
4. In the Index column, enter a descriptive name and press **Enter**.

5. In the Columns column, optionally double-click the column and select a different column from the drop-down list.
6. Click into the Order column and select either ascending or descending sort order and press **Enter**.
7. Optionally, click the plus symbol  and select a column from the drop-down list and repeat step 7 to add one or more additional columns to the index definition.
8. Execute the change script.

Creating Indexes Based on an Existing Index Definition

If indexes already exist in a table, you can add new indexes to the table also by right-clicking an existing index and generating a statement that uses the properties of the existing item as default. After editing the properties as required and executing the SQL, a new index is added to the database.

To add an index to a table using SQL:

1. Connect to the database and show the respective data source in the Online Browser.
2. Expand the table to which you want to add an index and right-click an existing index in the Index folder.
3. Select **Show in new SQL Editor | Create** from the context menu or, holding down the right mouse button, drag the index into an open SQL Editor window and choose **Create** from the popup.
An SQL statement is generated in the SQL Editor window.
4. Edit the statement as required.
5. Click the **Execute**  button to execute the statement and to add the new index to the database.
6. In the Online Browser, right-click the database and choose **Refresh** from the context menu.

18.2 Views

Altova web site:  [database views](#)

In DatabaseSpy you can create a view from a SELECT statement in the SQL Editor, or copy the definition of an existing view via the context menu in the Online Browser. This way, you have frequently used complex queries stored in database and can later execute them with a single mouse click or use them as a basis for more fine-tuned queries.

Views are displayed in the Views folder of the Online Browser. You may have to refresh the data source to view a newly created view in the Online Browser. The context menu provides several [options](#) to manage the views in your database.

The SQL syntax in the instructions below may vary depending on the database kind you are working with.

To create a view in SQL Editor:

1. Create a query by typing in SQL statements or opening an SQL file.
2. Right-click in the SQL Editor window and select **Create View As** from the context menu. Alternatively, you can also select the menu option **SQL Refactoring | Create View As**.
The statement `CREATE VIEW [ View1] AS` is automatically inserted in front of the query and the view name `View1` is automatically highlighted.
3. Change the view name to a more descriptive one.
4. Click the **Execute**  button or press **F5** to create the view.
5. Refresh the data source to display the view in the Online Browser.

To create a view based on an existing view:

1. In the Online Browser, right-click an existing view and select **Show in new SQL Editor | Create** from the context menu.
A CREATE VIEW statement with the definition of the existing view is displayed in a new SQL Editor window.
2. Type a new name after the CREATE VIEW part of the statement and modify the SELECT part accordingly.
3. Click the **Execute**  button or press **F5** to create the view.
4. Refresh the data source to display the view in the Online Browser.

To modify a view:

1. In the Online Browser, right-click an existing view and select **Show in new SQL Editor | Alter** from the context menu.
An ALTER VIEW statement with the definition of the existing view is displayed in a new SQL Editor window.
2. Modify the view as required.
3. Click the **Execute**  button or press **F5** to modify the view.

18.3 Stored Procedures

Stored procedures can improve the performance of distributed applications by reducing the data traffic between server and client installations. Please note that you must register a stored procedure with the database before it can be called by a client program.

In DatabaseSpy, stored procedures that are registered with the database are displayed in a separate folder in the Online Browser. A context menu provides several maintenance options and, in addition, facilitates the [creation of SQL statements](#) for creating, altering, dropping, or executing the stored procedure.

DatabaseSpy provides sub-folders for the procedures where the parameters are displayed. The definitions can be edited and renamed in the Properties window.

You can add stored procedures to the [favorites](#), [rename](#), or delete them. When deleting a stored procedure, a database structure change script is generated which must be executed in order for the deletion to take effect.

18.4 Triggers

Triggers are user-defined functions that are executed automatically after a CREATE, UPDATE, or DELETE statement on tables or views is executed. In SQL Server 2005, triggers can also be fired on database level.

If a trigger is defined for a particular table, view, or—with SQL Server 2005—database, the SQL statement(s) in the trigger definition are executed automatically before, after, or instead of the statement that activates the trigger.

Creating and deleting triggers

You can use an existing trigger as a basis for creating a new trigger definition or delete a trigger from the database. The [context menu](#) in the Online Browser provides several options in this respect.

18.5 User-defined Functions

DatabaseSpy supports user-defined functions and displays them in a separate folder on the schema/database level. For each function, a Parameters sub-folder is provided where the function's parameters and their data types are listed.

Functions can be added to the [favorites](#) and a [context menu](#) provides some maintenance options. Please note that functions are not supported in Access and MySQL 4 databases.

Be sure to always add the schema prefix to the function name when you select a function.

18.6 Creating Packages

DatabaseSpy now supports the definition of PL/SQL packages for Oracle databases. Packages are objects that group related PL/SQL types, items, and subtrees into modules and thus allow you to re-use code.

Packages consist of a package specification and an optional package body. The specification is the interface and the body defines cursors and subprograms.

Packages are defined with the commands:

```
CREATE [OR REPLACE] PACKAGE package_name
```

```
...
```

```
[CREATE [OR REPLACE] PACKAGE BODY package_name
```

```
...
```

18.7 Menus

The **Menus** section contains a complete description of all DatabaseSpy menu commands. We've tried to make this user manual as comprehensive as possible. If, however, you have questions which are not covered in the User Reference or other parts of this documentation, please look up the [FAQs](#) and Discussion Forums on the Altova website. If you are still not able to have your problem satisfactorily addressed, please do not hesitate to contact us through the [Support Center](#) on the Altova website.

Note that in the [File](#) and [Edit](#) menus, all standard Windows commands are supported, as well as additional database-related commands.

18.7.1 File Menu

The **File** menu contains all commands relevant to manipulating files, in the order common to most Windows software products.

In addition to the standard [Open](#), [Save](#), [Print](#), [Print Setup](#), and [Exit](#) commands, DatabaseSpy offers a range of application-specific commands.

Create a Database Connection...

Ctrl+Q

The **Create Database Connection...** command opens the **Add a Data Source** dialog box allowing you to choose between the generic Connection Wizard, creating ADO or ODBC connections, and Global Resources.

In the [General Options](#), you can specify whether or not the **Add a Data Source** dialog box should be displayed upon startup of the application.

New

The **New** sub-menu contains options for opening new [projects](#), [SQL Editor](#) and [Design Editor](#) windows, [data comparisons](#), and [schema comparisons](#).

Project

Ctrl+Shift+N

The **Project** command creates a new [project](#) in DatabaseSpy. If you are currently working with another project, a prompt appears, asking if you want to close all documents belonging to the current project.

SQL Editor

Ctrl+N

The **SQL Editor** command opens a new [SQL Editor window](#).

Design Editor

Ctrl+D

The **Design Editor** command opens a new [Design Editor window](#). Please note that you need an active database connection in order to open a Design Editor window.

Data Comparison

The **Data Comparison** command opens a new Data Comparison window and the **Select Database Objects for Comparison** dialog box, where you can select tables from two databases that you want to compare. Note that you can disable the display of the selection dialog box in the Data Compare options.

When no data source exists in your project, DatabaseSpy displays a warning message which allows you to add a data source immediately.

Click **Yes** in the message box to open the **Create a Database Connection** dialog box.

Also make sure that at least one data source is connected before you select the command to avoid the following message.

Schema Comparison

The **Schema Comparison** command opens a new Schema Comparison window and the **Select Database Objects for Comparison** dialog box, where you can select tables from two database schemas that you want to compare. Note that you can disable the display of the selection dialog box in the Data Compare options.

When no data source exists in your project, DatabaseSpy displays a warning message which allows you to add a data source immediately.

Click **Yes** in the message box to open the **Create a Database Connection** dialog box.

Also make sure that at least one data source is connected before you select the command to avoid the following message.

Open

The **Open** sub-menu provides options for opening [projects](#), [files](#), and [Altova Global Resources](#).

Open Project...

Ctrl+Shift+O

The **Open Project...** command opens an existing [project](#) in DatabaseSpy. The standard Windows **Open** dialog box appears where you can choose a project file (*.qprj). If you are currently working with another project, the previous project is closed first.

Open File...

Ctrl+O

The **Open...** command pops up the familiar Windows **Open** dialog box and allows you to open any project file (*.qprj), SQL file (*.sql), design file (*.qdes), database data comparison file (*.dbdif), or database schema comparison file (*.dbsdif). In the **Open** dialog box, you can select more than one file to open. Use the **Files of Type** combo box to restrict the kind of files displayed in the dialog box.

Open Global Resource...

The **Open Global Resource...** command opens the **Choose Global Resource** dialog box where you can select a file or folder and [display](#) it in the SQL Editor. The **Open Global**

Resources dialog...  button allows you to display the **Manage Global Resources** dialog box where you can [make changes](#) to a resource prior to opening it.

If you select a folder that has been defined as a global resource, then the standard Windows **Open** dialog box appears and displays the content of the directory that is defined for the active configuration.

Reload

The **Reload** command reloads the version of the active file that is saved in your file system. Any changes that you made in DatabaseSpy will be lost. You can still keep the updated version by clicking **No** in the message box that pops up.

Close

The **Close** command closes the active window. If the file was modified (indicated by an asterisk * after the file name in the title bar), you will be asked if you wish to save the file first.

Close All

The **Close All** command closes all open windows. If any document has been modified (indicated by an asterisk * after the file name in the title bar), you will be asked if you wish to save the file first.

Please note that the project will not be closed by the **Close All** command. A project can only be closed by opening a new project or by exiting DatabaseSpy.

Save

Ctrl+S

The **Save** command saves the contents of the active window to the file from which it has been opened. If the active window contains a new file, the [Save As...](#) dialog box is opened

automatically.

Save As...

The **Save As...** command pops up the familiar Windows **Save As** dialog box, in which you enter the name and location of the file you wish to save the active file as.

Save Project As...

The **Save Project As...** command saves the project that is currently open under a new name or at a different path. The standard Windows **Save As** dialog box appears where you can enter the desired file name and path.

Save All

Ctrl+Shift+S

The **Save All** command saves all modifications that have been made to any open documents. The command is useful if you edit multiple documents simultaneously. If a document has not been saved before (for example, after being newly created), the **Save As...** dialog box is presented for that document.

Print...

Ctrl+P

The **Print...** command opens the Print dialog box, in which you can select printer options and print the active file.

Please note that the **Print...** command behaves differently depending on whether it is called from an SQL Editor window or Design Editor window:

- Choosing the **Print...** command from an **SQL Editor** window brings up the standard windows **Print** dialog box.
- If you select the **Print...** command for a design file in the **Design Editor**, DatabaseSpy presents a **Print** dialog box where you can choose which part of the design file is to be printed and adapt the zoom. Choosing the **Print** button brings up the standard Windows **Print** dialog box. Click the **Preview** button to open the [preview window](#) and check the layout before printing or change the [printer setup](#) by clicking the **Print Setup** button.

Print Preview

The **Print Preview** command opens a preview window where you can check the layout of your active window before printing.

Please note that the **Print Preview** command behaves differently depending on whether it is called from an SQL Editor window or Design Editor window:

- If you select **File | Print Preview** from an active **SQL Editor** window, a preview window opens immediately where you can browse the pages and zoom in or zoom out using the appropriate buttons.

- When called from an active **Design Editor** window, the **Print Preview** command will first open the **Print** dialog box for design files. Click the **Preview** button to open the preview window where you can browse the pages and zoom in or zoom out using the appropriate buttons. If you click the **Close** button, the **Print** dialog box reappears and you can either print the file or cancel the operation.

Print Setup...

The **Print Setup...** command displays the printer-specific **Print Setup** dialog box, in which you specify such printer settings as paper format and page orientation. These settings are applied to all subsequent print jobs.

Recent Files

The **Recent Files** command in the **File** menu opens a sub-menu displaying a list of the four most recently used files, with the most recently opened file shown at the top of the list. You can open any of these files by clicking its name. To open a file in the list using the keyboard, press

Alt+F to open the File menu, and then press the number of the file you want to open.

Recent Projects

The **Recent Projects** command opens a submenu displaying the file name for the four most recently used projects, allowing quick access to these files.

Also note, that DatabaseSpy can automatically open the last project that you used, whenever you start DatabaseSpy. (**Tools | Options | General | [Open last project on startup](#)**).

Exit

The **Exit** command is used to quit DatabaseSpy. If you have any open files with unsaved changes, you are prompted to save these changes. DatabaseSpy also saves modifications to program settings and information about the most recently used files.

18.7.2 Edit Menu

The **Edit** menu contains commands for editing text in the SQL Editor window.

Different options are provided if the active window is a Design Editor.

Undo

Alt+Backspace

The **Undo** command contains support for unlimited levels of Undo. Every action can be undone

and it is possible to undo one command after another. The Undo history is retained after using the **Save** command, enabling you go back to the state the document was in before you saved your changes.

Redo

Ctrl+Y

The **Redo** command allows you to redo previously undone commands, thereby giving you a complete history of work completed. You can step back and forward through this history using the **Undo** and **Redo** commands.

Cut

Shift+Delete

The **Cut** command copies the selected text to the clipboard and deletes it from its present location.

Copy

Ctrl+C

The **Copy** command copies the selected text to the clipboard. This can be used to duplicate data within DatabaseSpy or to move data to another application.

Paste

Ctrl+V

The **Paste** command inserts the contents of the clipboard at the current cursor position.

Select User Tables

Alt+T

The **Select User Tables** command selects all user tables that are contained in the active Design Editor window.

Select System Tables

Alt+S

The **Select System Tables** command selects all system tables that are contained in the active Design Editor window.

Select All

Ctrl+A

The **Select All** command selects (i) any text in the currently active SQL Editor window or (ii) all tables in the currently active Design Editor window.

Find...**Ctrl+F**

The **Find** command pops up the [Find](#) dialog, in which you can specify the string you want to find and other options for the search.

Find Next**F3**

The **Find next** command repeats the last [Find...](#) command to search for the next occurrence of the requested text.

Replace...**Ctrl+H**

The **Replace** command enables you to find and replace one text string with another text string. It features the same options as the [Find...](#) command. You can replace each item individually or you can use the **Replace All** button to perform a global search-and-replace operation.

18.7.3 View Menu

The **View** menu contains commands for switching the various windows on or off.

**Online Browser**

This command lets you switch the [Online Browser](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Project Window

This command lets you switch the [Project window](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Property Window

This command lets you switch the [Property window](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Overview Window

This command lets you switch the [Overview window](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Data Inspector Window

This command lets you switch the [Data Inspector window](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Charts Window

This command lets you switch the [Chart window](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Output Window

This command lets you switch the [Output window](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Database Structure Change Script

This command lets you switch the [Database Structure Change Script window](#) on or off.

This is a dockable window. Dragging on its title bar detaches it from its current position and makes it a floating window. Click right on the title bar to allow docking or hide the window.

Status

The **Status** command toggles on and off the Status bar.

Toggle All Side Windows

This command toggles on and off the display of the Online Browser and the Project, Properties, and Overview windows as well as any other window that has been docked to the side of the application. Note that this command applies also to windows that are docked on the right side of DatabaseSpy.

Toggle Output and Change Script Windows

This command toggles the display of the Output and Change Script windows on and off.

18.7.4 SQL Editor Menu

The **SQL Editor** menu contains commands for selecting, editing, and executing SQL statements.

The **SQL Editor** menu is only visible if the active window contains an SQL file.

Execute

F5

The **Execute** command [executes all the SQL statements](#) that are currently in the active window of the SQL Editor. You can [customize the behaviour](#) of the Execute command in Properties window of the active SQL Editor options.

The **Stop Retrieval** command stops the retrieval of database data. The data that has been retrieved so far is displayed in the Result tab. Use the **Retrieve next n rows** button or the

Retrieve outstanding rows button, respectively, or the context menu in the Result view to resume retrieval. This button replaces the **Execute** button while data is being retrieved.

Execute for Data Editing

The **Execute for Data Editing** command executes a SELECT statement in the Online Browser and switches the Result window into the Editing Mode so that you are able to update or even add new data directly in the result grid. This command is only available if data editing from within the SQL Editor is supported for the data source connection you are currently working with.

Please note: This command is supported only for SELECT statements in the SQL Editor.

Navigation

The **Navigation** sub-menu contains options for selecting statements in the active SQL Editor window.

	Next Statement	Alt+Down
	Previous Statement	Alt+Up
	Last Statement	Alt+End
	First Statement	Alt+Home
	Select entire Statement	Shift+Alt+Enter

Next Statement

Alt+Down

The **Next Statement** command selects the statement following the statement in which the cursor is currently located.

Previous Statement

Alt+Up

The **Previous Statement** command selects the statement preceding the statement in which the cursor is currently located.

Last Statement

Alt+End

The **Last Statement** command selects the last statement in active window of the SQL Editor.

First Statement

Alt+Home

The **First Statement** command selects the first statement in the active window of the SQL Editor.

Select Entire Statement

**Shift+Alt+Enter**

The **Select Entire Statement** command selects the SQL statement in which the cursor is currently located.

Insert

The **Insert** sub-menu contains options for inserting [block](#) and [line](#) comments, [targets](#), and [regions](#) into the active SQL Editor window.

The **Insert/Remove Block Comment** and **Insert/Remove Line Comment** options are toggle commands that can also be used to remove a previously inserted comment.

Insert/Remove Block Comment

The **Insert/Remove Block comment** inserts or removes a [block comment](#) around the currently selected text block in the active window of the SQL Editor.

Insert/Remove Line Comment

The **Insert/Remove line comment** command inserts [line comment](#) from the current position of the cursor to the end of the line or removes a selected line comment.

Insert Target

The **Insert Target** command inserts `--Target: Result` before the currently marked SELECT statement. Executing the statement places the result in a tab named "Result". The text "Result" can be edited, allowing you to create your [own named tabs](#).

Please note that in the Properties window of the active SQL Editor either "Semicolons" or "SQL Grammar" must be selected in the `Group statements for execution with drop-down` list in order to support the `target` keyword.

Insert Region

The **Insert Region** command creates a [region](#) for the currently selected block of text. Regions can be folded or expanded by clicking the **+** icon.

Bookmarks

The **Bookmarks** sub-menu provides commands for inserting and removing bookmarks, and allows you to navigate between the bookmarks in an SQL Editor window.

Insert/Remove Bookmark

The **Insert/Remove Bookmark** command inserts a bookmark at the line of the current cursor position, or removes the bookmark if the cursor is in a line that has been bookmarked previously.

Bookmarked lines are displayed in one of the following ways:

- If the [bookmarks margin](#) has been enabled, then a solid cyan ellipse appears to the left of the text in the bookmark margin.
- If the bookmarks margin has not been enabled, then the complete line containing the cursor is highlighted.

Go to Next Bookmark

The **Go to Next Bookmark** command places the text cursor at the beginning of the next bookmarked line.

Go to Previous Bookmark

The **Go to Previous Bookmark** command places the text cursor at the beginning of the previous bookmarked line.

Remove All Bookmarks

The **Remove All Bookmarks** command removes all the defined bookmarks from the SQL Editor window that is currently active.

Please note: The **Undo** command does not undo the effects of this command.

Result View

The **Result view** command toggles all Result tabs in SQL Editor windows on and off.

Message View

The **Message view** command toggles the Message tab in SQL Editor windows on and off.

Stack Result Windows

If the **Stack Result Windows** option is deactivated, results of queries are displayed in separate, sequentially numbered tabs of the Result window (Result1, Result2, etc.). If the option is activated, all results are displayed in a single result tab with multiple panes for the individual queries.

Show Groupings For Execution

The **Show groupings for execution** command toggles the display of [execution groups for SQL statements](#) on and off.

Word Wrap

The **Word Wrap** command enables or disables word wrapping in the SQL Editor.

Text View Settings

The **Text View Settings** command opens the **Text View Settings** dialog box where you can [define settings](#) for the display of line number, bookmark, and source folding margins, specify the tab size, and define which visual aids are available in the SQL Editor.

18.7.5 SQL Refactoring Menu

The **SQL Refactoring** menu contains commands for changing the layout of SQL code in the SQL Editor.

The **SQL Refactoring** menu is only visible if the active window contains an SQL file.

Format SQL

The **Format SQL** command applies SQL formatting as currently defined for the respective database kind to the active SQL Editor Window.

A message is displayed in the Message tab, after the formatting has been completed.

Add Semicolons

The **Add Semicolons** command appends a semicolon to the end of each statement. No semicolon will be added however if it already exists in a statement.

Remove Semicolons

The **Remove Semicolons** command removes all semicolons from the end of statements. It makes no difference whether the semicolons have been entered manually or using the [Add Semicolons](#) command.

Add Quotations to Identifiers

This command adds database-specific quotations (e.g., ", ' [], etc.) to the table and column identifiers in the SQL Editor.

Remove Quotations from Identifiers

This command removes database-specific quotations (e.g., ", ' [], etc.) from the table and column identifiers in the SQL Editor. It makes no difference whether the identifiers have been entered manually or using the [Add Quotations to Identifiers](#) command.

Create View As

The **Create View As** command [creates a view](#) from a SELECT statement in the active SQL Editor window. A view is a stored query.

Uppercase Keywords

The **Uppercase Keywords** converts all keywords in the active SQL Editor into uppercase.

Expand Columns for Star Expressions

The **Expand columns for star expressions** command inserts the full column list of a table if the cursor is placed after the asterisk in a SELECT statement and the command is executed.

Note that the SQL statement must be complete and valid. If, for example, the `SQL Editor should require semicolons` option is checked, the terminating semicolon must indeed be present in the SQL Editor.

Remove Comments

This command removes all text that is enclosed in comment marks (`*/.../*` and `--`). Please note that the **Remove Comments** command removes the text that has been comment out and **not** the command marks! To remove the comment marks, use the [Insert/Remove Block Comment](#) and [Insert/Remove Line Comment](#) commands.

Remove Comments and Formatting

The **Remove Comments and Formatting** command reverts all formatting that has been added by the [Format SQL](#) command, that is, any additional line feed or whitespace is removed and the SQL is displayed in one line. In addition, this command removes all text that has been commented out.

18.7.6 Design Editor Menu

The **Design Editor** menu contains commands for maintaining database objects in a graphical manner.

The **Design Editor** menu is only visible if the active window contains a design file.

Create New Table

Ctrl+T

The **Create New Table** command creates a new table in the currently active Design Editor window and automatically assigns it to the active data source. A Database Structure Change Script is generated and has to be executed to add the newly created table to the database.

Create New Column

Alt+C

The **Create New Column** command adds a new column to the selected table. Please note that if you have selected more than one table, the column will be added to the table that was selected last.

Add Sticky Note

**Alt+N**

The **Add Sticky Note** command adds a Sticky Note to the Design Editor window. Double-click the note to enter text and drag it to the desired position.

Add Related Tables

The **Add Related Tables** command opens a sub-menu which adds tables that are either referenced by or are referencing the selected table.

Referenced Tables

The **Referenced Tables** command adds tables that are referenced by the selected table to the active Design Editor window.

Referencing Tables

The **Referencing Tables** command adds tables which include a reference to the selected table to the active Design Editor window.

All Relations

The **All Relations** command adds both referenced and referencing tables to the active Design Editor window.

SQL and Data

The **SQL and Data** command opens a sub-menu which provides options for [generating SQL scripts](#), [retrieving](#), and [editing](#) data from within the design view.

Show in new SQL Editor

The **Show in new SQL Editor** command opens a sub-menu which enables you to create SQL statements from the selected tables in the Design Editor.

If more than one table is selected, a statement is created for each of the selected tables. Please note that different statements are created depending on what you have selected:

- If you have selected the **entire table**, one statement is created for all of the columns in the table.

```
SELECT [AnimalTypeID], [EnglishName], [LatinName],
[AreaOfOrigin], [Category] FROM [ZooDB].[dbo].[tblAnimalTypes];
```

- If you have selected a **single column**, the statement is created for this particular column only.

```
SELECT [EnglishName] FROM [ZooDB].[dbo].[tblAnimalTypes];
```

- If you have selected **some but not all of the columns**, one statement is created for the selected columns.

```
SELECT [EnglishName], [AreaOfOrigin] FROM
[ZooDB].[dbo].[tblAnimalTypes];
```

Retrieve Data

The **Retrieve Data** command opens a sub-menu which enables you to perform a query on the selected table in the Design Editor.

All rows

The **All rows** command generates a SELECT statement for all rows in a new SQL Editor window and executes the query immediately. The result of the query is displayed in the Result tab below the SQL Editor window.

First n rows

The **First n rows** command generates a SELECT statement for the first n rows in a new SQL Editor window and executes the query immediately. The result of the query is displayed in the Result tab below the SQL Editor window.

You can customize the number of rows to be retrieved in the [SQL Editor options](#).

Edit Data

Ctrl+Alt+E

The **Edit Data** command retrieves data from the selected table or columns and switches the result grid into the editing mode (if supported for the respective data source).

Zoom In

Ctrl+Num +

The **Zoom In** command increases the zoom factor of the Design Editor window by 10 percent. You can also zoom in by scrolling (with the scroll-wheel of the mouse) while keeping the **Ctrl** key pressed.

Zoom Out

Ctrl+Num -

The **Zoom Out** command decreases the zoom factor of the Design Editor window by 10 percent. You can also zoom out by scrolling (with the scroll-wheel of the mouse) while keeping the **Ctrl** key pressed.

Zoom to Fit

The **Zoom to Fit** command sizes the working area to include all tables in the current Design Editor window.

Auto Layout Whole Diagram

The **Auto Layout Whole Diagram** command arranges all tables in the active Design Editor window in a way that considers relations between the individual tables as well as proper layouting.

Auto Layout Selected Tables

The **Auto Layout Selected Tables** command arranges the selected tables in the active Design Editor window in a way that considers relations between the individual tables as well as a proper layouting.

Remove from Design

Ctrl+Del

The **Remove from Design** command removes the selected table from the Design Editor window. Please note that the table is not deleted from the database in this case. To drop a table from the database use the [Delete Selected Objects](#) command instead.

Delete Selected Objects

Del

The **Delete Selected Objects** command generates a Database Structure Change Script and marks the selected objects for deletion. You must execute the change script in order to actually delete the objects from the database.

You can select multiple objects for deletion. If you select one or more database objects of a table as well as the table itself and press the **Delete** key, DatabaseSpy prompts you to choose whether you want to delete the entire table or only its objects.

Export Database Data

The **Export Database Data** command opens the [Export database data](#) dialog box where you can define the export settings. If you have tables selected in the Design Editor window, the check boxes of these tables will already be activated in the Source group box of the **Export database data** dialog box and thus selected for export.

Save Diagram As Image

The **Save Diagram As Image** command opens the standard Windows **Save As** dialog box where you can specify a name and location for the design image. The designs can be stored as Portable Network Graphics (*.png) or Enhanced Meta Files (*.emf).

Generate Database Structure Change Script

The **Generate Database Structure Change Script** command starts the generation of a change script or updates it after changes occurred to the database structure. Please note that this menu option is not available if in the [General options](#) you have activated the `Instantly` radio button in the Database Structure Change Script group box.

Show Design Options

The **Show Design Options** command opens the [Design Editor page of the Options](#) dialog box where you can customize the settings for the Design Editor.

18.7.7 Data Comparison Menu

The **Data Comparison** menu contains all the commands that are related to the comparison of database data.

The **Data Comparison** menu is only visible if the active window contains a data comparison file.

Compare Tables

The **Compare Tables** command starts a comparison of the tables that you have selected in the Data Comparison window.

Merge Left to Right

The **Merge Left to Right** command updates the tables in the right comparison component with the data contained in the tables in the left component. Missing table rows are added and obsolete rows are deleted. The required SQL script is generated and executed in the background. DatabaseSpy displays a warning message which has to be confirmed before the changes are actually committed to the database.

Merge Right to Left

The **Merge Right to Left** command updates the tables in the left comparison component with the data contained in the tables in the right component. Missing table rows are added and obsolete rows are deleted. The required SQL script is generated and executed in the background. DatabaseSpy displays a warning message which has to be confirmed before the changes are actually committed to the database.

Show Results

The **Show Results** command displays the Comparison Result window for the selected table(s) or for all mapped tables in the active Data Comparison window, if no table is selected.

SQL and Data

The **SQL and Data** sub-menu of the **Data Comparison** menu provides options for showing the merge and restore scripts for both sides of a comparison.

The commands of the **SQL and Data** sub-menu are only available after a comparison has been started.

Show merge script: Left to Right

The **Show merge script: Left to Right** command opens a new SQL Editor window and displays an SQL change script that overwrites the data in the table(s) contained in the right component with the values of the mapped table(s) of the left component.

Show merge script: Right to Left

The **Show merge script: Right to Left** command opens a new SQL Editor window and displays an SQL change script that overwrites the data in the table(s) contained in the left component with the values of the mapped table(s) of the right component.

Show restore script: Left

The **Show restore script: Left** command reverts the changes that have been made to the left table and restores the condition the left table had before the merge script was executed.

Show restore script: Right

The **Show restore script: Right** command reverts the changes that have been made to the right table and restores the condition the right table had before the merge script was executed.

Sort Tables

The **Sort Tables** sub-menu of the **Data Comparison** menu provides options for sorting the tables that are included in the components of a database data comparison.

Please note that the commands always affect both sides of the comparison (i.e., you cannot sort just one component).

Ascending

The **Ascending** command sorts all tables in a comparison window in ascending order.

Descending

The **Descending** command sorts all tables in a comparison window in descending order.

Ascending mapped first

The **Ascending mapped first** command sorts all tables in a Data Comparison window and displays the mapped tables in ascending order first (*see screenshot*).

Descending mapped first

The **Descending mapped first** command sorts all tables in a Data Comparison window and displays the mapped tables in descending order first (*see screenshot*).

Map items

The **Map items** command tries to map all tables in the Data Comparison window using the settings defined in the [Data Compare](#) section of the **Options** dialog box.

Unmap items

The **Unmap items** command deletes all mappings in the active comparison window. If one or more tables are selected in the components, only the mapping of the selected tables will be deleted.

Expand tables

The **Expand tables** command expands all tables in both components of the active comparison window.

Collapse tables

The **Collapse tables** command collapses all tables in both components of the active comparison window.

Autolayout

The **Autolayout** command fits the components into the visible part of the comparison window, tries to avoid horizontal scrollbars in the components, and aligns the top and bottom borders of the components.

Show Comparison Options

The **Show Comparison Options** command opens the [Data Compare](#) section of the **Options** dialog page.

18.7.8 Schema Comparison Menu

The **Schema Comparison** menu contains all the commands that are related to the comparison of database schemas.

The **Schema Comparison** menu is only visible if the active window contains a schema comparison file.

Compare items

The **Compare items** command starts a comparison of the tables that you have selected in the Schema Comparison window.

Show merge script: Left to Right

The **Show merge script: Left to Right** command opens a new SQL Editor window and displays an SQL change script that overwrites the table structure(s) contained in the right component with those of the mapped table(s) of the left component.

Please note that only selected items are included in the merge script and that child items are not automatically considered in the merge script when their parents are selected. If you want to merge both parent and children you must select all items.

Consider the following example: Two versions of a database are compared where one column is misspelled and the data type of that column has been changed on purpose between the two versions. If child entries would be automatically merged if a parent entry is selected for merging,

you would not be able to correct the type in the column name without setting the data type back to its old setting.

Show merge script: Right to Left

The **Show merge script: Right to Left** command opens a new SQL Editor window and displays an SQL change script that overwrites the table structure(s) contained in the left component with those of the mapped table(s) of the right component.

Please note that only selected items are included in the merge script and that child items are not automatically considered in the merge script when their parents are selected. If you want to merge both parent and children you must select all items.

Consider the following example: Two versions of a database are compared where one column is misspelled and the data type of that column has been changed on purpose between the two versions. If child entries would be automatically merged if a parent entry is selected for merging, you would not be able to correct the type in the column name without setting the data type back to its old setting.

Sort Items

The **Sort items** sub-menu of the **Schema Comparison** menu provides options for sorting the tables that are included in the components of a database schema comparison.

Please note that the commands always affect both sides of the comparison (i.e., you cannot sort just one component).

Ascending

The **Ascending** command sorts all tables in a comparison window in ascending order.

Descending

The **Descending** command sorts all tables in a comparison window in descending order.

Ascending mapped first

The **Ascending mapped first** command sorts all tables in a Schema Comparison window and displays the mapped tables in ascending order first (*see screenshot*).

Descending mapped first

The **Descending mapped first** command sorts all tables in a Schema Comparison window and displays the mapped tables in descending order first (*see screenshot*).

Map items

The **Map items** command tries to map all tables in the Schema Comparison window using the settings defined in the [Data Compare](#) section of the **Options** dialog box.

Unmap Items

The **Unmap items** command deletes all mappings in the active comparison window. If one or more tables are selected in the components, only the mapping of the selected tables will be deleted.

Expand items

The **Expand items** command expands all items in both components of the active comparison window.

Collapse items

The **Collapse items** command collapses all items in both components of the active comparison window.

Autolayout

The **Autolayout** command fits the components into the visible part of the comparison window, tries to avoid horizontal scrollbars in the components, and aligns the top and bottom borders of the components.

Show Comparison Options

The **Show Comparison Options** command opens the [Data Compare](#) section of the **Options** dialog page.

18.7.9 Tools Menu

The **Tools** menu allows you to:

- [Export](#) and [import](#) database data
- Generate [SQL change scripts](#)
- [Manage XML schemas](#) for databases
- Access [user-defined tools](#)
- Manage [Global Resources](#) and [configurations](#)
- [Customize](#) menus, toolbars, etc.
- Define the global program [settings](#)

Export Database Data...

Ctrl+E

The **Export Database Data...** command opens the [Export Database Data](#) dialog box where you can define your export options.

Import Data to the Database...

Ctrl+I

The **Import Data to Database...** command opens the [Import data to the database](#) dialog box where you can define your import options.

Generate Change Script

The **Generate Change Script** command starts the generation of a change script or updates it after changes occurred to the database structure. Please note that this menu option is not available if in the [General options](#) you have activated the `Instantly` radio button in the Database Structure Change Script group box.

XML Schema Management for Databases...

The **XML Schema Management for Databases** command opens the **XML Schema management for databases** dialog box which allows you to select a data source connection and [add](#), [drop](#), [modify](#), or [view](#) XML schemas for the active data source.

User-defined Tools

The **User-defined Tools** command opens a sub-menu where you can add your personal menu items, e.g., links to other applications.

To add a user-defined tool, select the menu option **Tools | Customize** or right-click into the toolbar and select **Customize** from the context menu. Change to the [Tools tab](#) and add name of and path to the EXE file of the application you want to start from within DatabaseSpy. The name you entered in the Menu contents box appears in the **Tools | User-defined Tools** sub-menu.

Global Resources...

The **Global Resources...** command opens the **Manage Global Resources** dialog box, where you can add, edit, or delete [global resources](#).

Active Configurations

The **Active configurations** command opens a sub-menu, where all available configurations are listed and the active configuration is indicated. Selecting a configuration in the sub-menu will make it the active configuration.

Customize...

The **Customize...** command lets you customize DatabaseSpy to suit your personal needs.

Commands

The **Commands** tab allows you customize your menus or toolbars.

To add a command to a toolbar or menu:

1. Select the menu option **Tools | Customize**.
The **Customize** dialog box appears.
2. Select the **All Commands** category in the Categories list box.
The available commands appear in the Commands list box.
3. Click on a command in the Commands list box and drag it to an existing menu or toolbar.
An **I**-beam appears when you place the cursor over a valid position to drop the command.
4. Release the mouse button at the position you want to insert the command.
 - A small button appears at the tip of mouse pointer when you drag a command. The "x" below the pointer means that the command cannot be dropped at the current cursor position.
 - The "x" disappears whenever you can drop the command (over a tool bar or menu).
 - Placing the cursor over a menu when dragging opens it, allowing you to insert the command anywhere in the menu.
 - Commands can be placed in menus or toolbars. If you created your own toolbar you can populate it with your own commands/icons.

Please note: You can also edit the commands in the [context menus](#) (right-click anywhere to open the context menu), using the same method. Click the **Menu** tab and then select the specific context menu available in the Context Menus combo box.

Toolbars

The **Toolbars** tab allows you to activate or deactivate specific toolbars, as well as create your own specialized ones.

DatabaseSpy toolbars contain symbols for the most frequently used menu commands. For each symbol you get a brief "tool tip" explanation when the mouse cursor is directly over the item and the status bar shows a more detailed description of the command.

You can drag the toolbars from their standard position to any location on the screen, where they appear as a floating window. Alternatively, you can also dock them to the left or right edge of the main window.

**Show text labels:**

This option displays explanatory text below toolbar icons when activated. You can activate or deactivate this option for each toolbar individually.

To activate or deactivate a toolbar:

- Click the check box to activate (or deactivate) the specific toolbar.

To create a new toolbar:

1. Click the **New...** button, and give the toolbar a name in the **Toolbar Name** dialog box that appears.
2. Drag commands to the toolbar in the [Commands](#) tab of the **Customize** dialog box.

To reset the Menu Bar:

1. Click the Menu Bar entry.
2. Click the **Reset** button, to reset the menu commands to the state they were in when DatabaseSpy was installed.

To reset all toolbar and menu commands:

1. Click the **Reset All** button to reset all the toolbar commands to the state they were when the program was installed.
A prompt appears stating that all toolbars and menus will be reset.
2. Click **Yes** to confirm the reset.

To change a toolbar name:

- Click the **Rename...** button to edit the name of the toolbar.

This option is available only for user-defined toolbars.

To delete a toolbar:

- Select the toolbar you want to delete in the Toolbars list box.
- Click the **Delete** button.
A prompt appears, asking if you really want to delete the toolbar.
- Click **Yes** to confirm the deletion.

This option is available only for user-defined toolbars.

Tools

The **Tools** tab allows you to add your personal menu items, e.g., links to other applications, to the **Tools** menu.

Any user-defined entries will appear in the **User-defined tools** sub-menu.

**To add a user-defined tool:**

- Click the **New**  icon in the Menu contents title bar or press the **Insert** key.
- In the text field that appears, enter the string that is to appear as menu entry in the **Tools** menu.

3. In the `Command` field enter the path to the EXE file of the application or use the browse  button to select the path.
4. If applicable, enter arguments needed to start the application in the `Arguments` field.
5. Enter the path to the initial directory, if required.

To change the sequence of user-defined tools:

- Select an entry and use the **Move Item Up**  and **Move Item Down**  buttons to move the menu item.
Alternatively, you can also use the shortcut keys **Alt+Up** and **Alt+Down** to move the entry.

To rename a user-defined menu item:

- Double-click an item in the `Menu contents` field and edit the entry.

To remove a user-defined tool:

- Select the entry you want to remove from the Tools menu and click the **Delete**  icon in the Menu contents title bar or press the **Delete** key.

Keyboard

The **Keyboard** tab allows you to define (or change) keyboard shortcuts for any DatabaseSpy command.

In the `Set accelerator` for drop-down list, you can differentiate between shortcuts that are valid in the Default menu or in the DatabaseSpy Design menu.

To assign a new Shortcut to a command:

1. Select the All Commands category using the `Category` combo box.

2. Select the command you want to assign a new shortcut to, in the `Commands` list box.
3. Click in the `Press New Shortcut Key` text box, and press the shortcut keys that are to activate the command.
The shortcuts appear immediately in the text box. If the shortcut was assigned previously, then that function is displayed below the text box.
4. Click the **Assign** button to assign the shortcut.
The shortcut now appears in the `Current Keys` list box.
(To clear this text box, press any of the control keys, **CTRL**, **ALT** or **SHIFT**).

To de-assign or delete a shortcut:

1. Click the shortcut you want to delete in the `Current Keys` list box.
2. Click the **Remove** button.
3. Click the **Close** button to confirm.

To reset all shortcut keys:

1. Click the **Reset All** button to reset all the shortcut keys to the state they were when the program was installed.
A prompt appears stating that all toolbars and menus will be reset.
2. Click **Yes** to confirm the reset.

Ctrl+Z

Alt+Backspace

Menu

The **Menu** tab allows you to customize the main menu bars as well as the context menus.

You can customize the Default, the SQL, the Design, the Database Data Comparison, and the Database Schema Comparison menu bars.

The Default menu is the one visible when no SQL Editor or Design Editor or Data Comparison windows are open in DatabaseSpy.

The SQL menu is the menu bar that is displayed when at least one SQL Editor window has been opened.

The Design menu is the menu bar visible when at least one Design Editor window has been opened.

The Database Data Comparison menu bar is visible when at least one Data Comparison window has been opened.

The Database Schema Comparison menu bar is visible when at least one Schema Comparison window has been opened.

Menu animations and menu shadows

You can choose from among several menu animations if you prefer animated menus. The `Menu animations` drop-down box provides the following options:

- None (default)
- Unfold
- Slide
- Fade

The `Menu shadows` check box, which is checked by default, can be deactivated if you do not want all your menus to have shadows.

To customize a menu:

1. Select the menu bar you want to customize from the `Show Menus for` combo box.
2. Click the [Commands](#) tab, and drag the commands to the menu bar of your choice.

To delete commands from a menu:

1. Select the menu option **Tools | Customize** to open the **Customize** dialog box.
2. Do one of the following:
 - Right-click the command or icon representing the command and select the **Delete** option from the context menu.
 - Drag the command away from the menu, and drop it as soon as the check mark icon appears below the mouse pointer.

To reset either of the menu bars:

1. Select either the Default, the SQL, the Design, or the Database Data Comparison entry in the `Show Menus for` combo box.
2. Click the **Reset** button just below the menu name.
A prompt appears asking if you are sure you want to reset the menu bar.
3. Click **Yes**.

To customize any of the context menus (right-click menus):

1. Select the context menu from the `Select context menu` combo box.
The context menu you selected appears.
2. Click the [Commands](#) tab, and drag the commands to the context menu.

To delete commands from a context menu:

1. Select the menu option **Tools | Customize** to open the **Customize** dialog box.
2. Do one of the following:
 - Right-click on the command or icon representing the command and select the **Delete** option from the context menu.
 - Drag the command away from the context menu, and drop it as soon as the check mark icon appears below the mouse pointer.

To reset any of the context menus:

1. Select the context menu from the combo box.

2. Click the **Reset** button just below the context menu name.
A prompt appears asking if you are sure you want to reset the context menu.

To close a context menu window:

Do one of the following:

- Click on the **Close icon** at the top right of the title bar.
- Click the **Close** button of the **Customize** dialog box.

To change the appearance of menus:

1. If you want animated menus, select the appropriate option from the `Menu animations` drop-down box.
2. If required, deactivate the `Menu shadows` check box.

Options

The Options tab allows you to set general environment settings.

Toolbar

When active, the `Show ScreenTips on toolbars` check box displays a popup when the mouse pointer is placed over an icon in any of the icon bars. The popup contains a short description of the icon function, as well as the associated keyboard shortcut, if one has been assigned.

The `Show shortcut keys in ScreenTips` check box allows you to decide whether or not you want to have the shortcut displayed in the tooltip.

When active, the `Large icons` check box switches between the standard size icons, and larger versions of the icons.

Options...

Ctrl+Alt+O

The **Options** command opens the **Options** dialog box where you can set the [General options](#) as well as specific settings for [SQL](#) or [Design Editor](#) or [Data Comparison](#) windows.

18.7.10 Window Menu

To organize the individual windows in an DatabaseSpy session, the **Window** menu contains standard commands common to most Windows applications. You can also switch to an open document window directly from the menu.

You can cascade the open windows, tile them, or arrange document icons once you have minimized them.

Cascade

The **Cascade** command rearranges all open document windows so that they are all cascaded (i.e., staggered) on top of each other.

Tile horizontally

The **Tile horizontally** command rearranges all open document windows as **horizontal tiles**, making them all visible at the same time.

Tile vertically

The **Tile vertically** command rearranges all open document windows as **vertical tiles**, making them all visible at the same time.

Currently open window list

This list shows all currently open windows and lets you quickly switch between them.

You can also use the **Ctrl+TAB** or **Ctrl+F6** keyboard shortcuts to cycle through the open windows.

Windows...

At the bottom of the list of open windows is the **Windows...** command. Clicking this entry opens the **Windows** dialog box, which displays a list of all open windows and provides commands that can be applied to the selected window(s). A window is selected by clicking on its name.

Warning: To exit the **Windows** dialog box, click **OK**; do **not** click the **Close Window(s)** button in the dialog box. The **Close Window(s)** button closes the window(s) currently selected in the **Windows** dialog box.

18.7.11 Help Menu

The **Help** menu contains commands required to get help or more information on DatabaseSpy, as well as links to information and support pages on our web server.

The **Help** menu also contains the Registration dialog, which lets you enter your license key-code once you have purchased the product.

Table of Contents

F1

The **Table of Contents** command displays a **hierarchical representation** of all chapters and topics contained in the online help system. Use this command to jump to the table of contents directly from within DatabaseSpy.

Once the help window is open, use the three tabs to navigate between the table of contents, [index](#), and [search](#) panes. The Favorites tab lets you bookmark certain pages within the help system.

Index...

The **Index...** command accesses the **keyword index** of the Online Help. You can also use the Index tab in the left pane of the online help system.

The index lists all relevant keywords and lets you navigate to a topic by double-clicking the respective keyword. If more than one topic matches the selected keyword, you are presented a list of available topics to choose from.

Search...

The **Search...** command performs a **full-text search** on the entire online help system.

1. Enter your search term in the query field and press Enter.
The online help system displays a list of available topics that contain the search term you've entered.
2. Double-click on any item in the list to display the corresponding topic.

Software activation...

After you download your Altova product software, you can activate it using either a free evaluation key or a purchased permanent license key.

- **Free evaluation key.** When you first start the software after downloading and installing it, the **Software Activation** dialog will pop up. In it is a button to request a free evaluation key-code. Enter your name, company, and e-mail address in the dialog that appears, and click **Request Now!** The evaluation key is sent to the e-mail address you entered and should reach you in a few minutes. Now enter the key in the key-code field of the Software Activation dialog box and click **OK** to start working with your Altova product. The software will be unlocked for a period of 30 days.
- **Permanent license key.** The Software Activation dialog contains a button to purchase a permanent license key. Clicking this button takes you to Altova's online shop, where you can purchase a permanent license key for your product. There are two types of permanent license: single-user and multi-user. Both will be sent to you by e-mail. A single-user license contains your license-data and includes your name, company, e-mail, and key-code. A multi-user license contains your license-data and includes your company name and key-code. Note that your license agreement does not allow you to install more than the licensed number of copies of your Altova software on the computers in your organization (per-seat license). Please make sure that you enter the data required in the registration dialog exactly as given in your license e-mail.

Note: When you enter your license information in the Software Activation dialog, ensure that you enter the data exactly as given in your license e-mail. For multi-user licenses, each user should enter his or her own name in the Name field.

The Software Activation dialog can be accessed at any time by clicking the **Help | Software Activation** command.

Order form...

When you are ready to order a licensed version of the software product, you can use either the **Order license key** button in the **Software Activation** dialog (see [Software Activation](#)) or the **Help | Order Form** command to proceed to the secure Altova Online Shop.

Registration...

The first time you start your Altova software after having activated it, a dialog appears asking whether you would like to register your product. There are three buttons in this dialog:

- **OK:** Takes you to the Registration Form
- **Remind Me Later:** Pops up a dialog in which you can select when you wish to be next reminded.

- **Cancel:** Closes the dialog and suppresses it in future. If you wish to register at a later time, you can use the Help | Registration command.

Check for updates...

Checks with the Altova server whether a newer version than yours is currently available and displays a message accordingly.

Support center...

If you have any questions regarding our product, please feel free to use this command to send a query to the Altova Support Center at any time. This is the place where you'll find links to the FAQ, support form, and e-mail addresses for contacting our support staff directly.

FAQ on the web...

To help you in getting the best support possible, we are providing a list of Frequently Asked Questions (FAQ) on the Internet, that is constantly updated as our support staff encounters new issues that are raised by our customers.

Please make sure to check the FAQ before contacting our technical support team. This will allow you to get help more quickly.

We regret that we are not able to offer technical support by phone at this time, but our support staff will typically answer your e-mail requests within one business day.

If you would like to make a feature suggestion for a future version of DatabaseSpy or if you wish to send us any other general feedback, please use the questionnaire form.

Download components and free tools...

This command is a link to the Components Download page at the Altova website, from where you can download components, free tools, and third-party add-ins. Such software ranges from XSLT and XSL-FO processors to Application Server Platforms.

DatabaseSpy on the internet

The **DatabaseSpy on the Internet** command takes you directly to the [Altova web-server](#) where you can find out about news, product updates and additional offers from the Altova team.

About DatabaseSpy

The **About DatabaseSpy** command shows the DatabaseSpy splash screen and copyright information dialog box, which includes the version number of your product and the DatabaseSpy logo. If you are using the 64-bit version of DatabaseSpy, this is indicated with the suffix (x64) after the application name. There is no suffix for the 32-bit version.

Chapter 19

License Information

19 License Information

This section contains:

- Information about the [distribution of this software product](#)
- Information about the [intellectual property rights](#) related to this software product
- The [End User License Agreement](#) governing the use of this software product

Please read this information carefully. It is binding upon you since you agreed to these terms when you installed this software product.

19.1 Electronic Software Distribution

This product is available through electronic software distribution, a distribution method that provides the following unique benefits:

- You can evaluate the software free-of-charge before making a purchasing decision.
- Once you decide to buy the software, you can place your order online at the [Altova website](#) and immediately get a fully licensed product within minutes.
- When you place an online order, you always get the latest version of our software.
- The product package includes a comprehensive integrated onscreen help system. The latest version of the user manual is available at www.altova.com (i) in HTML format for online browsing, and (ii) in PDF format for download (and to print if you prefer to have the documentation on paper).

30-day evaluation period

After downloading this product, you can evaluate it for a period of up to 30 days free of charge. About 20 days into this evaluation period, the software will start to remind you that it has not yet been licensed. The reminder message will be displayed once each time you start the application. If you would like to continue using the program after the 30-day evaluation period, you have to purchase an [Altova Software License Agreement](#), which is delivered in the form of a key-code that you enter into the Software Activation dialog to unlock the product. You can purchase your license at the online shop at the [Altova website](#).

Helping Others within Your Organization to Evaluate the Software

If you wish to distribute the evaluation version within your company network, or if you plan to use it on a PC that is not connected to the Internet, you may only distribute the Setup programs, provided that they are not modified in any way. Any person that accesses the software installer that you have provided, must request their own 30-day evaluation license key code and after expiration of their evaluation period, must also purchase a license in order to be able to continue using the product.

For further details, please refer to the [Altova Software License Agreement](#) at the end of this section.

19.2 Software Activation and License Metering

As part of Altova's Software Activation, the software may use your internal network and Internet connection for the purpose of transmitting license-related data at the time of installation, registration, use, or update to an Altova-operated license server and validating the authenticity of the license-related data in order to protect Altova against unlicensed or illegal use of the software and to improve customer service. Activation is based on the exchange of license related data such as operating system, IP address, date/time, software version, and computer name, along with other information between your computer and an Altova license server.

Your Altova product has a built-in license metering module that further helps you avoid any unintentional violation of the End User License Agreement. Your product is licensed either as a single-user or multi-user installation, and the license-metering module makes sure that no more than the licensed number of users use the application concurrently.

This license-metering technology uses your local area network (LAN) to communicate between instances of the application running on different computers.

Single license

When the application starts up, as part of the license metering process, the software sends a short broadcast datagram to find any other instance of the product running on another computer in the same network segment. If it doesn't get any response, it will open a port for listening to other instances of the application.

Multi license

If more than one instance of the application is used within the same LAN, these instances will briefly communicate with each other on startup. These instances exchange key-codes in order to help you to better determine that the number of concurrent licenses purchased is not accidentally violated. This is the same kind of license metering technology that is common in the Unix world and with a number of database development tools. It allows Altova customers to purchase reasonably-priced concurrent-use multi-user licenses.

We have also designed the applications so that they send few and small network packets so as to not put a burden on your network. The TCP/IP ports (2799) used by your Altova product are officially registered with the IANA (see [the IANA website \(http://www.iana.org/\)](http://www.iana.org/) for details) and our license-metering module is tested and proven technology.

If you are using a firewall, you may notice communications on port 2799 between the computers that are running Altova products. You are, of course, free to block such traffic between different groups in your organization, as long as you can ensure by other means, that your license agreement is not violated.

You will also notice that, if you are online, your Altova product contains many useful functions; these are unrelated to the license-metering technology.

19.3 Intellectual Property Rights

The Altova Software and any copies that you are authorized by Altova to make are the intellectual property of and are owned by Altova and its suppliers. The structure, organization and code of the Software are the valuable trade secrets and confidential information of Altova and its suppliers. The Software is protected by copyright, including without limitation by United States Copyright Law, international treaty provisions and applicable laws in the country in which it is being used. Altova retains the ownership of all patents, copyrights, trade secrets, trademarks and other intellectual property rights pertaining to the Software, and that Altova's ownership rights extend to any images, photographs, animations, videos, audio, music, text and "applets" incorporated into the Software and all accompanying printed materials. Notifications of claimed copyright infringement should be sent to Altova's copyright agent as further provided on the Altova Web Site.

Altova software contains certain Third Party Software that is also protected by intellectual property laws, including without limitation applicable copyright laws as described in detail at http://www.altova.com/legal_3rdparty.html.

All other names or trademarks are the property of their respective owners.

19.4 Altova End User License Agreement

THIS IS A LEGAL DOCUMENT -- RETAIN FOR YOUR RECORDS

ALTOVA® END USER LICENSE AGREEMENT

Licensors:
Altova GmbH
Rudolfplatz 13a/9
A-1010 Wien
Austria

Important - Read Carefully. Notice to User:

This End User License Agreement (“Software License Agreement”) is a legal document between you and Altova GmbH (“Altova”). It is important that you read this document before using the Altova-provided software (“Software”) and any accompanying documentation, including, without limitation printed materials, ‘online’ files, or electronic documentation (“Documentation”). By clicking the “I accept” and “Next” buttons below, or by installing, or otherwise using the Software, you agree to be bound by the terms of this Software License Agreement as well as the Altova Privacy Policy (“Privacy Policy”) including, without limitation, the warranty disclaimers, limitation of liability, data use and termination provisions below, whether or not you decide to purchase the Software. You agree that this agreement is enforceable like any written agreement negotiated and signed by you. If you do not agree, you are not licensed to use the Software, and you must destroy any downloaded copies of the Software in your possession or control. You may print a copy of this Software License Agreement as part of the installation process at the time of acceptance. Alternatively, you may go to our Web site at <http://www.altova.com/eula> to download and print a copy of this Software License Agreement for your files and <http://www.altova.com/privacy> to review the Privacy Policy.

1. SOFTWARE LICENSE

(a) License Grant.

(i) Upon your acceptance of this Software License Agreement Altova grants you a non-exclusive, non-transferable (except as provided below), limited license, without the right to grant sublicenses, to install and use a copy of the Software on one compatible personal computer or workstation up to the Permitted Number of computers. Subject to the limitations set forth in Section 1(c), you may install and use a copy of the Software on more than one of your compatible personal computers or workstations if you have purchased a Named-User license. Subject to the limitations set forth in Sections 1(d) and 1(e), users may use the software concurrently on a network. The Permitted Number of computers and/or users and the type of license, e.g. Installed, Named-Users, and Concurrent-User, shall be determined and specified at such time as you elect to purchase the Software. Installed user licenses are intended to be fixed and not concurrent. In other words, you cannot uninstall for one user in order to reinstall that license to a different user and then uninstall and reinstall back to the original user. Users should be static. Notwithstanding the foregoing, permanent switchovers are acceptable (i.e., an employee has left the company, machine is retired). During the evaluation period, hereinafter defined, only a single user may install and use the software on one (1) personal computer or workstation. If you have licensed the Software as part of a suite of Altova software products (collectively, the “Suite”) and have not installed each product individually, then the Software License Agreement governs your use of all of the software included in the Suite.

(ii) If you have licensed SchemaAgent, then the terms and conditions of this Software License Agreement apply to your use of the SchemaAgent server software (“SchemaAgent Server”) included therein, as applicable, and you are licensed to use

SchemaAgent Server solely in connection with your use of Altova Software and solely for the purposes described in the accompanying documentation.

(iii) If you have licensed Software that enables users to generate source code, your license to install and use a copy of the Software as provided herein permits you to generate source code based on (i) Altova Library modules that are included in the Software (such generated code hereinafter referred to as the “Restricted Source Code”) and (ii) schemas or mappings that you create or provide (such code as may be generated from your schema or mapping source materials hereinafter referred to as the “Unrestricted Source Code”). In addition to the rights granted herein, Altova grants you a non-exclusive, non-transferable, limited license to compile the complete generated code (comprised of the combination of the Restricted Source Code and the Unrestricted Source Code) into executable object code form, and to use, copy, distribute or license that executable. You may not distribute or redistribute, sublicense, sell, or transfer the Restricted Source Code to a third-party unless said third-party already has a license to the Restricted Source Code through their separate agreement with Altova. Notwithstanding anything to the contrary herein, you may not distribute, incorporate or combine with other software, or otherwise use the Altova Library modules or Restricted Source Code, or any Altova intellectual property embodied in or associated with the Altova Library modules or Restricted Source Code, in any manner that would subject the Restricted Source Code to the terms of a copyleft, free software or open source license that would require the Restricted Source Code or Altova Library modules source code to be disclosed in source code form. Altova reserves all other rights in and to the Software. With respect to the feature(s) of UModel that permit reverse-engineering of your own source code or other source code that you have lawfully obtained, such use by you does not constitute a violation of this Agreement. Except as otherwise expressly permitted in Section 1(i) reverse engineering of the Software is strictly prohibited as further detailed therein.

(iv) In the event Restricted Source Code is incorporated into executable object code form, you will include the following statement in (1) introductory splash screens, or if none, within one or more screens readily accessible by the end-user, and (2) in the electronic and/or hard copy documentation: “Portions of this program were developed using Altova® [name of Altova Software, e.g. MapForce® 2011] and include libraries owned by Altova GmbH, Copyright © 2007-2011 Altova GmbH (www.altova.com).”

(b) Server Use for Installation and Use of SchemaAgent. You may install one (1) copy of the Software on a computer file server within your internal network solely for the purpose of downloading and installing the Software onto other computers within your internal network up to the Permitted Number of computers in a commercial environment only. If you have licensed SchemaAgent, then you may install SchemaAgent Server on any server computer or workstation and use it in connection with your Software. No other network use is permitted, including without limitation using the Software either directly or through commands, data or instructions from or to a computer not part of your internal network, for Internet or Web-hosting services or by any user not licensed to use this copy of the Software through a valid license from Altova.

(c) Named-Use. If you have licensed the “Named-User” version of the software, you may install the Software on up to five (5) compatible personal computers or workstations of which you are the primary user thereby allowing you to switch from one computer to the other as necessary provided that only one (1) instance of the Software will be used by you as the Named-User at any given time. If you have purchased multiple Named-User licenses, each individual Named-User will receive a separate license key code.

(d) Concurrent Use in Same Physical Network or Office Location. If you have licensed a “Concurrent-User” version of the Software, you may install the Software on any compatible computers in a commercial environment only, up to ten (10) times the Permitted Number of users, provided that only the Permitted Number of users actually use the Software at the same time and further provided that the computers on which the Software is installed are on the same

physical computer network. The Permitted Number of concurrent users shall be delineated at such time as you elect to purchase the Software licenses. Each separate physical network or office location requires its own set of separate Concurrent User Licenses for those wishing to use the Concurrent User versions of the Software in more than one location or on more than one network, all subject to the above Permitted Number limitations and based on the number of users using the Software. If a computer is not on the same physical network, then a locally installed user license or a license dedicated to concurrent use in a virtual environment is required. Home User restrictions and limitations with respect to the Concurrent User licenses used on home computers are set forth in Section 1(g).

(e) Concurrent Use in Virtual Environment. If you have purchased Concurrent-User Licenses, you may install a copy of the Software on a terminal server (Microsoft Terminal Server, Citrix Metaframe, etc.), application virtualization server (Microsoft App-V, Citrix XenApp, VMWare ThinApp, etc.) or virtual machine environment within your internal network for the sole and exclusive purpose of permitting individual users within your organization to access and use the Software through a terminal server, application virtualization session, or virtual machine environment from another computer provided that the total number of users that access or use the Software concurrently at any given point in time on such network, virtual machine or terminal server does not exceed the Permitted Number; and provided that the total number of users authorized to use the Software through the terminal server, application virtualization session, or virtual machine environment does not exceed six (6) times the Permitted Number of users. Accordingly, the limitations set forth in Section 1(d) regarding the number of installations and the requirement that the usage be on the same physical network shall not apply to terminal server, application virtualization session, or virtual machine environments. In a virtual environment, you must deploy a means of preventing users from exceeding the Permitted Number of concurrent users. Altova makes no warranties or representations about the performance of Altova software in a terminal server, application virtualization session, or virtual machine environment and the foregoing are expressly excluded from the limited warranty in Section 5 hereof and technical support is not available with respect to issues arising from use in such environments.

(f) Backup and Archival Copies. You may make one (1) backup and one (1) archival copy of the Software, provided your backup and archival copies are not installed or used on any computer and further provided that all such copies shall bear the original and unmodified copyright, patent and other intellectual property markings that appear on or in the Software. You may not transfer the rights to a backup or archival copy unless you transfer all rights in the Software as provided under Section 3.

(g) Home Use (Personal and Non-Commercial). In order to further familiarize yourself with the Software and allow you to explore its features and functions, you, as the primary user of the computer on which the Software is installed for commercial purposes, may also install one copy of the Software on only one (1) home personal computer (such as your laptop or desktop) solely for your personal and non-commercial ("HPNC") use. This HPNC copy may not be used in any commercial or revenue-generating business activities, including without limitation, work-from-home, teleworking, telecommuting, or other work-related use of the Software. The HPNC copy of the Software may not be used at the same time on a home personal computer as the Software is being used on the primary computer.

(h) Key Codes, Upgrades and Updates. Prior to your purchase and as part of the registration for the thirty (30) day evaluation period, as applicable, you will receive an evaluation key code. You will receive a purchase key code when you elect to purchase the Software from either Altova GmbH or an authorized reseller. The purchase key code will enable you to activate the Software beyond the initial evaluation period. You may not re-license, reproduce or distribute any key code except with the express written permission of Altova. If the Software that you have licensed is an upgrade or an update, then the latest update or upgrade that you download and install replaces all or part of the Software previously licensed. The update or upgrade and the associated license keys does not constitute the granting of a second license to

the Software in that you may not use the upgrade or updated copy in addition to the copy of the Software that it is replacing and whose license has terminated.

(i) **Title.** Title to the Software is not transferred to you. Ownership of all copies of the Software and of copies made by you is vested in Altova, subject to the rights of use granted to you in this Software License Agreement. As between you and Altova, documents, files, stylesheets, generated program code (including the Unrestricted Source Code) and schemas that are authored or created by you via your utilization of the Software, in accordance with its Documentation and the terms of this Software License Agreement, are your property unless they are created using Evaluation Software, as defined in Section 4 of this Agreement, in which case you have only a limited license to use any output that contains generated program code (including Unrestricted Source Code) such as Java, C++, C#, VB.NET or XSLT and associated project files and build scripts, as well as generated XML, XML Schemas, documentation, UML diagrams, and database structures only for the thirty (30) day evaluation period.

(j) **Reverse Engineering.** Except and to the limited extent as may be otherwise specifically provided by applicable law in the European Union, you may not reverse engineer, decompile, disassemble or otherwise attempt to discover the source code, underlying ideas, underlying user interface techniques or algorithms of the Software by any means whatsoever, directly or indirectly, or disclose any of the foregoing, except to the extent you may be expressly permitted to decompile under applicable law in the European Union, if it is essential to do so in order to achieve operability of the Software with another software program, and you have first requested Altova to provide the information necessary to achieve such operability and Altova has not made such information available. Altova has the right to impose reasonable conditions and to request a reasonable fee before providing such information. Any information supplied by Altova or obtained by you, as permitted hereunder, may only be used by you for the purpose described herein and may not be disclosed to any third party or used to create any software which is substantially similar to the expression of the Software. Requests for information from users in the European Union with respect to the above should be directed to the Altova Customer Support Department.

(k) **Other Restrictions.** You may not loan, rent, lease, sublicense, distribute or otherwise transfer all or any portion of the Software to third parties except to the limited extent set forth in Section 3 or as otherwise expressly provided. You may not copy the Software except as expressly set forth above, and any copies that you are permitted to make pursuant to this Software License Agreement must contain the same copyright, patent and other intellectual property markings that appear on or in the Software. You may not modify, adapt or translate the Software. You may not, directly or indirectly, encumber or suffer to exist any lien or security interest on the Software; knowingly take any action that would cause the Software to be placed in the public domain; or use the Software in any computer environment not specified in this Software License Agreement.

You will comply with applicable law and Altova's instructions regarding the use of the Software. You agree to notify your employees and agents who may have access to the Software of the restrictions contained in this Software License Agreement and to ensure their compliance with these restrictions.

(l) **THE SOFTWARE IS NEITHER GUARANTEED NOR WARRANTED TO BE ERROR-FREE NOR SHALL ANY LIABILITY BE ASSUMED BY ALTOVA IN THIS RESPECT. NOTWITHSTANDING ANY SUPPORT FOR ANY TECHNICAL STANDARD, THE SOFTWARE IS NOT INTENDED FOR USE IN OR IN CONNECTION WITH, WITHOUT LIMITATION, THE OPERATION OF NUCLEAR FACILITIES, AIRCRAFT NAVIGATION, COMMUNICATION SYSTEMS, AIR TRAFFIC CONTROL EQUIPMENT, MEDICAL DEVICES OR LIFE SUPPORT SYSTEMS, MEDICAL OR HEALTH CARE APPLICATIONS, OR OTHER APPLICATIONS WHERE THE FAILURE OF THE SOFTWARE OR ERRORS IN DATA PROCESSING COULD LEAD TO DEATH, PERSONAL INJURY OR SEVERE PHYSICAL OR ENVIRONMENTAL DAMAGE. YOU AGREE THAT YOU ARE SOLELY RESPONSIBLE FOR**

THE ACCURACY AND ADEQUACY OF THE SOFTWARE AND ANY DATA GENERATED OR PROCESSED BY THE SOFTWARE FOR YOUR INTENDED USE AND YOU WILL DEFEND, INDEMNIFY AND HOLD ALTOVA, ITS OFFICERS AND EMPLOYEES HARMLESS FROM ANY 3RD PARTY CLAIMS, DEMANDS, OR SUITS THAT ARE BASED UPON THE ACCURACY AND ADEQUACY OF THE SOFTWARE IN YOUR USE OR ANY DATA GENERATED BY THE SOFTWARE IN YOUR USE.

2. INTELLECTUAL PROPERTY RIGHTS

Acknowledgement of Altova's Rights. You acknowledge that the Software and any copies that you are authorized by Altova to make are the intellectual property of and are owned by Altova and its suppliers. The structure, organization and code of the Software are the valuable trade secrets and confidential information of Altova and its suppliers. The Software is protected by copyright, including without limitation by United States Copyright Law, international treaty provisions and applicable laws in the country in which it is being used. You acknowledge that Altova retains the ownership of all patents, copyrights, trade secrets, trademarks and other intellectual property rights pertaining to the Software, and that Altova's ownership rights extend to any images, photographs, animations, videos, audio, music, text and "applets" incorporated into the Software and all accompanying printed materials. You will take no actions which adversely affect Altova's intellectual property rights in the Software. Trademarks shall be used in accordance with accepted trademark practice, including identification of trademark owners' names. Trademarks may only be used to identify printed output produced by the Software, and such use of any trademark does not give you any right of ownership in that trademark. XMLSpy®, Authentic®, StyleVision®, MapForce®, UModel®, DatabaseSpy®, DiffDog®, SchemaAgent®, SemanticWorks®, MissionKit®, Markup Your Mind®, Nanonull™, and Altova® are trademarks of Altova GmbH. (registered in numerous countries). Unicode and the Unicode Logo are trademarks of Unicode, Inc. Windows, Windows XP, Windows Vista, and Windows 7 are trademarks of Microsoft. W3C, CSS, DOM, MathML, RDF, XHTML, XML and XSL are trademarks (registered in numerous countries) of the World Wide Web Consortium (W3C); marks of the W3C are registered and held by its host institutions, MIT, INRIA and Keio. Except as expressly stated above, this Software License Agreement does not grant you any intellectual property rights in the Software. Notifications of claimed copyright infringement should be sent to Altova's copyright agent as further provided on the Altova Web Site.

3. LIMITED TRANSFER RIGHTS

Notwithstanding the foregoing, you may transfer all your rights to use the Software to another person or legal entity provided that: (a) you also transfer each of this Software License Agreement, the Software and all other software or hardware bundled or pre-installed with the Software, including all copies, updates and prior versions, and all copies of font software converted into other formats, to such person or entity; (b) you retain no copies, including backups and copies stored on a computer; (c) the receiving party secures a personalized key code from Altova; and (d) the receiving party accepts the terms and conditions of this Software License Agreement and any other terms and conditions upon which you legally purchased a license to the Software. Notwithstanding the foregoing, you may not transfer education, pre-release, or not-for-resale copies of the Software.

4. PRE-RELEASE AND EVALUATION PRODUCT ADDITIONAL TERMS

If the product you have received with this license is pre-commercial release or beta Software ("Pre-release Software"), then this Section applies. In addition, this section applies to all evaluation and/or demonstration copies of Altova software ("Evaluation Software") and continues in effect until you purchase a license. To the extent that any provision in this section is in conflict with any other term or condition in this Software License Agreement, this section shall supersede such other term(s) and condition(s) with respect to the Pre-release and/or Evaluation Software, but only to the extent necessary to resolve the conflict. You acknowledge that the Pre-release Software is a pre-release version, does not represent final product from Altova, and

may contain bugs, errors and other problems that could cause system or other failures and data loss. CONSEQUENTLY, THE PRE-RELEASE AND/OR EVALUATION SOFTWARE IS PROVIDED TO YOU **“AS-IS” WITH NO WARRANTIES FOR USE OR PERFORMANCE**, AND ALTOVA DISCLAIMS ANY WARRANTY OR LIABILITY OBLIGATIONS TO YOU OF ANY KIND, WHETHER EXPRESS OR IMPLIED. WHERE LEGALLY LIABILITY CANNOT BE EXCLUDED FOR PRE-RELEASE AND/OR EVALUATION SOFTWARE, BUT IT MAY BE LIMITED, ALTOVA'S LIABILITY AND THAT OF ITS SUPPLIERS SHALL BE LIMITED TO THE SUM OF FIFTY DOLLARS (USD \$50) IN TOTAL. If the Evaluation Software has a time-out feature, then the software will cease operation after the conclusion of the designated evaluation period. Upon such expiration date, your license will expire unless otherwise extended. Your license to use any output created with the Evaluation Software that contains generated program code (including Unrestricted Source Code) such as Java, C++, C, VB.NET or XSLT and associated project files and build scripts as well as generated XML, XML Schemas, documentation, UML diagrams, and database structures terminates automatically upon the expiration of the designated evaluation period but the license to use such output is revived upon your purchase of a license for the Software that you evaluated and used to create such output. Access to any files created with the Evaluation Software is entirely at your risk. You acknowledge that Altova has not promised or guaranteed to you that Pre-release Software will be announced or made available to anyone in the future, that Altova has no express or implied obligation to you to announce or introduce the Pre-release Software, and that Altova may not introduce a product similar to or compatible with the Pre-release Software. Accordingly, you acknowledge that any research or development that you perform regarding the Pre-release Software or any product associated with the Pre-release Software is done entirely at your own risk. During the term of this Software License Agreement, if requested by Altova, you will provide feedback to Altova regarding testing and use of the Pre-release Software, including error or bug reports. If you have been provided the Pre-release Software pursuant to a separate written agreement, your use of the Software is governed by such agreement. You may not sublicense, lease, loan, rent, distribute or otherwise transfer the Pre-release Software. Upon receipt of a later unreleased version of the Pre-release Software or release by Altova of a publicly released commercial version of the Software, whether as a stand-alone product or as part of a larger product, you agree to return or destroy all earlier Pre-release Software received from Altova and to abide by the terms of the license agreement for any such later versions of the Pre-release Software.

5. LIMITED WARRANTY AND LIMITATION OF LIABILITY

(a) Limited Warranty and Customer Remedies. Altova warrants to the person or entity that first purchases a license for use of the Software pursuant to the terms of this Software License Agreement that (i) the Software will perform substantially in accordance with any accompanying Documentation for a period of ninety (90) days from the date of receipt, and (ii) any support services provided by Altova shall be substantially as described in Section 6 of this agreement. Some states and jurisdictions do not allow limitations on duration of an implied warranty, so the above limitation may not apply to you. To the extent allowed by applicable law, implied warranties on the Software, if any, are limited to ninety (90) days. Altova's and its suppliers' entire liability and your exclusive remedy shall be, at Altova's option, either (i) return of the price paid, if any, or (ii) repair or replacement of the Software that does not meet Altova's Limited Warranty and which is returned to Altova with a copy of your receipt. This Limited Warranty is void if failure of the Software has resulted from accident, abuse, misapplication, abnormal use, Trojan horse, virus, or any other malicious external code. Any replacement Software will be warranted for the remainder of the original warranty period or thirty (30) days, whichever is longer. This limited warranty does not apply to Evaluation and/or Pre-release Software.

(b) No Other Warranties and Disclaimer. THE FOREGOING LIMITED WARRANTY AND REMEDIES STATE THE SOLE AND EXCLUSIVE REMEDIES FOR ALTOVA OR ITS SUPPLIER'S BREACH OF WARRANTY. ALTOVA AND ITS SUPPLIERS DO NOT AND CANNOT WARRANT THE PERFORMANCE OR RESULTS YOU MAY OBTAIN BY USING

THE SOFTWARE. EXCEPT FOR THE FOREGOING LIMITED WARRANTY, AND FOR ANY WARRANTY, CONDITION, REPRESENTATION OR TERM TO THE EXTENT WHICH THE SAME CANNOT OR MAY NOT BE EXCLUDED OR LIMITED BY LAW APPLICABLE TO YOU IN YOUR JURISDICTION, ALTOVA AND ITS SUPPLIERS MAKE NO WARRANTIES, CONDITIONS, REPRESENTATIONS OR TERMS, EXPRESS OR IMPLIED, WHETHER BY STATUTE, COMMON LAW, CUSTOM, USAGE OR OTHERWISE AS TO ANY OTHER MATTERS. TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, ALTOVA AND ITS SUPPLIERS DISCLAIM ALL OTHER WARRANTIES AND CONDITIONS, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, SATISFACTORY QUALITY, INFORMATIONAL CONTENT OR ACCURACY, QUIET ENJOYMENT, TITLE AND NON-INFRINGEMENT, WITH REGARD TO THE SOFTWARE, AND THE PROVISION OF OR FAILURE TO PROVIDE SUPPORT SERVICES. THIS LIMITED WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS. YOU MAY HAVE OTHERS, WHICH VARY FROM STATE/JURISDICTION TO STATE/JURISDICTION.

(c) Limitation of Liability. TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW EVEN IF A REMEDY FAILS ITS ESSENTIAL PURPOSE, IN NO EVENT SHALL ALTOVA OR ITS SUPPLIERS BE LIABLE FOR ANY SPECIAL, INCIDENTAL, DIRECT, INDIRECT OR CONSEQUENTIAL DAMAGES WHATSOEVER (INCLUDING, WITHOUT LIMITATION, DAMAGES FOR LOSS OF BUSINESS PROFITS, BUSINESS INTERRUPTION, LOSS OF BUSINESS INFORMATION, OR ANY OTHER PECUNIARY LOSS) ARISING OUT OF THE USE OF OR INABILITY TO USE THE SOFTWARE OR THE PROVISION OF OR FAILURE TO PROVIDE SUPPORT SERVICES, EVEN IF ALTOVA HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. IN ANY CASE, ALTOVA'S ENTIRE LIABILITY UNDER ANY PROVISION OF THIS SOFTWARE LICENSE AGREEMENT SHALL BE LIMITED TO THE AMOUNT ACTUALLY PAID BY YOU FOR THE SOFTWARE PRODUCT. Because some states and jurisdictions do not allow the exclusion or limitation of liability, the above limitation may not apply to you. In such states and jurisdictions, Altova's liability shall be limited to the greatest extent permitted by law and the limitations or exclusions of warranties and liability contained herein do not prejudice applicable statutory consumer rights of person acquiring goods otherwise than in the course of business. The disclaimer and limited liability above are fundamental to this Software License Agreement between Altova and you.

(d) Infringement Claims. Altova will indemnify and hold you harmless and will defend or settle any claim, suit or proceeding brought against you by a third party that is based upon a claim that the content contained in the Software infringes a copyright or violates an intellectual or proprietary right protected by United States or European Union law ("Claim"), but only to the extent the Claim arises directly out of the use of the Software and subject to the limitations set forth in Section 5 of this Agreement except as otherwise expressly provided. You must notify Altova in writing of any Claim within ten (10) business days after you first receive notice of the Claim, and you shall provide to Altova at no cost such assistance and cooperation as Altova may reasonably request from time to time in connection with the defense of the Claim. Altova shall have sole control over any Claim (including, without limitation, the selection of counsel and the right to settle on your behalf on any terms Altova deems desirable in the sole exercise of its discretion). You may, at your sole cost, retain separate counsel and participate in the defense or settlement negotiations. Altova shall pay actual damages, costs, and attorney fees awarded against you (or payable by you pursuant to a settlement agreement) in connection with a Claim to the extent such direct damages and costs are not reimbursed to you by insurance or a third party, to an aggregate maximum equal to the purchase price of the Software. If the Software or its use becomes the subject of a Claim or its use is enjoined, or if in the opinion of Altova's legal counsel the Software is likely to become the subject of a Claim, Altova shall attempt to resolve the Claim by using commercially reasonable efforts to modify the Software or obtain a license to continue using the Software. If in the opinion of Altova's legal counsel the Claim, the injunction or potential Claim cannot be resolved through reasonable modification or licensing, Altova, at its own election, may terminate this Software License Agreement without penalty, and will refund to you on a pro rata basis any fees paid in advance by you to Altova. THE FOREGOING

CONSTITUTES ALTOVA'S SOLE AND EXCLUSIVE LIABILITY FOR INTELLECTUAL PROPERTY INFRINGEMENT. This indemnity does not apply to infringements that would not be such, except for customer-supplied elements.

6. SUPPORT AND MAINTENANCE

Altova offers multiple optional "Support & Maintenance Package(s)" ("SMP") for the version of Software product edition that you have licensed, which you may elect to purchase in addition to your Software license. The Support Period, hereinafter defined, covered by such SMP shall be delineated at such time as you elect to purchase a SMP. Your rights with respect to support and maintenance as well as your upgrade eligibility depend on your decision to purchase SMP and the level of SMP that you have purchased:

(a) If you have not purchased SMP, you will receive the Software AS IS and will not receive any maintenance releases or updates. However, Altova, at its option and in its sole discretion on a case by case basis, may decide to offer maintenance releases to you as a courtesy, but these maintenance releases will not include any new features in excess of the feature set at the time of your purchase of the Software. In addition, Altova will provide free technical support to you for thirty (30) days after the date of your purchase (the "Support Period" for the purposes of this paragraph 6(a), and Altova, in its sole discretion on a case by case basis, may also provide free courtesy technical support during your thirty (30) day evaluation period. Technical support is provided via a Web-based support form only, and there is no guaranteed response time.

(b) If you have purchased SMP, then solely for the duration of its delineated Support Period, **you are eligible to receive the version of the Software edition** that you have licensed and all maintenance releases and updates for that edition that are released during your Support Period. For the duration of your SMP's Support Period, you will also be eligible to receive upgrades to the comparable edition of the next version of the Software that succeeds the Software edition that you have licensed for applicable upgrades released during your Support Period. The specific upgrade edition that you are eligible to receive based on your Support Period is further detailed in the SMP that you have purchased. Software that is introduced as separate product is not included in SMP. Maintenance releases, updates and upgrades may or may not include additional features. In addition, Altova will provide Priority Technical Support to you for the duration of the Support Period. Priority Technical Support is provided via a Web-based support form only and Altova will make commercially reasonable efforts to respond via e-mail to all requests within forty-eight (48) hours during Altova's business hours (MO-FR, 8am UTC – 10pm UTC, Austrian and US holidays excluded) and to make reasonable efforts to provide work-arounds to errors reported in the Software.

During the Support Period you may also report any Software problem or error to Altova. If Altova determines that a reported reproducible material error in the Software exists and significantly impairs the usability and utility of the Software, Altova agrees to use reasonable commercial efforts to correct or provide a usable work-around solution in an upcoming maintenance release or update, which is made available at certain times at Altova's sole discretion.

If Altova, in its discretion, requests written verification of an error or malfunction discovered by you or requests supporting example files that exhibit the Software problem, you shall promptly provide such verification or files, by email, telecopy, or overnight mail, setting forth in reasonable detail the respects in which the Software fails to perform. You shall use reasonable efforts to cooperate in diagnosis or study of errors. Altova may include error corrections in maintenance releases, updates, or new major releases of the Software. Altova is not obligated to fix errors that are immaterial. Immaterial errors are those that do not significantly impact use of the Software as determined by Altova in its sole discretion. Whether or not you have purchased the Support & Maintenance Package, technical support only covers issues or questions resulting directly out of the operation of the Software and Altova will not provide you with generic consultation, assistance, or advice under any circumstances.

Updating Software may require the updating of software not covered by this Software License Agreement before installation. Updates of the operating system and application software not specifically covered by this Software License Agreement are your responsibility and will not be provided by Altova under this Software License Agreement. Altova's obligations under this Section 6 are contingent upon your proper use of the Software and your compliance with the terms and conditions of this Software License Agreement at all times. Altova shall be under no obligation to provide the above technical support if, in Altova's opinion, the Software has failed due to the following conditions: (i) damage caused by the relocation of the software to another location or CPU; (ii) alterations, modifications or attempts to change the Software without Altova's written approval; (iii) causes external to the Software, such as natural disasters, the failure or fluctuation of electrical power, or computer equipment failure; (iv) your failure to maintain the Software at Altova's specified release level; or (v) use of the Software with other software without Altova's prior written approval. It will be your sole responsibility to: (i) comply with all Altova-specified operating and troubleshooting procedures and then notify Altova immediately of Software malfunction and provide Altova with complete information thereof; (ii) provide for the security of your confidential information; (iii) establish and maintain backup systems and procedures necessary to reconstruct lost or altered files, data or programs.

7. SOFTWARE ACTIVATION, UPDATES AND LICENSE METERING

(a) **License Metering.** Altova has a built-in license metering module that helps you to avoid any unintentional violation of this Software License Agreement. Altova may use your internal network for license metering between installed versions of the Software.

(b) **Software Activation.** Altova's Software may use your internal network and Internet connection for the purpose of transmitting license-related data at the time of installation, registration, use, or update to an Altova-operated license server and validating the authenticity of the license-related data in order to protect Altova against unlicensed or illegal use of the Software and to improve customer service. Activation is based on the exchange of license related data between your computer and the Altova license server. You agree that Altova may use these measures and you agree to follow any applicable requirements. You further agree that use of license key codes that are not or were not generated by Altova and lawfully obtained from Altova, or an authorized reseller as part of an effort to activate or use the Software violates Altova's intellectual property rights as well as the terms of this Software License Agreement. You agree that efforts to circumvent or disable Altova's copyright protection mechanisms or license management mechanism violate Altova's intellectual property rights as well as the terms of this Software License Agreement. Altova expressly reserves the rights to seek all available legal and equitable remedies to prevent such actions and to recover lost profits, damages and costs.

(c) **LiveUpdate.** Altova provides a new LiveUpdate notification service to you, which is free of charge. Altova may use your internal network and Internet connection for the purpose of transmitting license-related data to an Altova-operated LiveUpdate server to validate your license at appropriate intervals and determine if there is any update available for you.

(d) **Use of Data.** The terms and conditions of the Privacy Policy are set out in full at <http://www.altova.com/privacy> and are incorporated by reference into this Software License Agreement. By your acceptance of the terms of this Software License Agreement and/or use of the Software, you authorize the collection, use and disclosure of information collected by Altova for the purposes provided for in this Software License Agreement and/or the Privacy Policy. Altova has the right in its sole discretion to amend this provision of the Software License Agreement and/or Privacy Policy at any time. You are encouraged to review the terms of the Privacy Policy as posted on the Altova Web site from time to time.

(e) **Notice to European Users.** Please note that the information as described in paragraph 7(d) above may be transferred outside of the European Economic Area, for purposes

of processing, analysis, and review, by Altova, Inc., a company located in Beverly, Massachusetts, U.S.A., or its subsidiaries or Altova's subsidiaries or divisions, or authorized partners, located worldwide. You are advised that the United States uses a sectoral model of privacy protection that relies on a mix of legislation, governmental regulation, and self-regulation. You are further advised that the Council of the European Union has found that this model does not provide "adequate" privacy protections as contemplated by Article 25 of the European Union's Data Directive. (Directive 95/46/EC, 1995 O.J. (L 281) 31). Article 26 of the European Union's Data Directive allows for transfer of personal data from the European Union to a third country if the individual has unambiguously given his consent to the transfer of personal information, regardless of the third country's level of protection. By agreeing to this Software License Agreement, you consent to the transfer of all such information to the United States and the processing of that information as described in this Software License Agreement and the Privacy Policy.

8. TERM AND TERMINATION

This Software License Agreement may be terminated (a) by your giving Altova written notice of termination; (b) by Altova, at its option, giving you written notice of termination if you commit a breach of this Software License Agreement and fail to cure such breach within ten (10) days after notice from Altova; or (c) at the request of an authorized Altova reseller in the event that you fail to make your license payment or other monies due and payable. In addition the Software License Agreement governing your use of a previous version that you have upgraded or updated of the Software is terminated upon your acceptance of the terms and conditions of the Software License Agreement accompanying such upgrade or update. Upon any termination of the Software License Agreement, you must cease all use of the Software that this Software License Agreement governs, destroy all copies then in your possession or control and take such other actions as Altova may reasonably request to ensure that no copies of the Software remain in your possession or control. The terms and conditions set forth in Sections 1(h), 1(i), 1(j), 1(k), 2, 5(b), 5(c), 5(d), 7(d), 7(e), 9, 10 and 11 survive termination as applicable.

9. RESTRICTED RIGHTS NOTICE AND EXPORT RESTRICTIONS

The Software was developed entirely at private expense and is commercial computer software provided with **RESTRICTED RIGHTS**. Use, duplication or disclosure by the U.S. Government or a U.S. Government contractor or subcontractor is subject to the restrictions set forth in this Agreement and as provided in FAR 12.211 and 12.212 (48 C.F.R. §12.211 and 12.212) or DFARS 227. 7202 (48 C.F.R. §227-7202) as applicable. Consistent with the above as applicable, Commercial Computer Software and Commercial Computer Documentation licensed to U.S. government end users only as commercial items and only with those rights as are granted to all other end users under the terms and conditions set forth in this Software License Agreement. Manufacturer is Altova GmbH, Rudolfplatz, 13a/9, A-1010 Vienna, Austria/EU. You may not use or otherwise export or re-export the Software or Documentation except as authorized by United States law and the laws of the jurisdiction in which the Software was obtained. In particular, but without limitation, the Software or Documentation may not be exported or re-exported (i) into (or to a national or resident of) any U.S. embargoed country or (ii) to anyone on the U.S. Treasury Department's list of Specially Designated Nationals or the U.S. Department of Commerce's Table of Denial Orders. By using the Software, you represent and warrant that you are not located in, under control of, or a national or resident of any such country or on any such list.

10. THIRD PARTY SOFTWARE

The Software may contain third party software which requires notices and/or additional terms and conditions. Such required third party software notices and/or additional terms and conditions are located at our Website at http://www.altova.com/legal_3rdparty.html and are made a part of and incorporated by reference into this Agreement. By accepting this Agreement, you are also accepting the additional terms and conditions, if any, set forth therein.

11. GENERAL PROVISIONS

If you are located in the European Union and are using the Software in the European Union and not in the United States, then this Software License Agreement will be governed by and construed in accordance with the laws of the Republic of Austria (excluding its conflict of laws principles and the U.N. Convention on Contracts for the International Sale of Goods) and you expressly agree that exclusive jurisdiction for any claim or dispute with Altova or relating in any way to your use of the Software resides in the Handelsgericht, Wien (Commercial Court, Vienna) and you further agree and expressly consent to the exercise of personal jurisdiction in the Handelsgericht, Wien (Commercial Court, Vienna) in connection with any such dispute or claim.

If you are located in the United States or are using the Software in the United States then this Software License Agreement will be governed by and construed in accordance with the laws of the Commonwealth of Massachusetts, USA (excluding its conflict of laws principles and the U.N. Convention on Contracts for the International Sale of Goods) and you expressly agree that exclusive jurisdiction for any claim or dispute with Altova or relating in any way to your use of the Software resides in the federal or state courts of the Commonwealth of Massachusetts and you further agree and expressly consent to the exercise of personal jurisdiction in the federal or state courts of the Commonwealth of Massachusetts in connection with any such dispute or claim.

If you are located outside of the European Union or the United States and are not using the Software in the United States, then this Software License Agreement will be governed by and construed in accordance with the laws of the Republic of Austria (excluding its conflict of laws principles and the U.N. Convention on Contracts for the International Sale of Goods) and you expressly agree that exclusive jurisdiction for any claim or dispute with Altova or relating in any way to your use of the Software resides in the Handelsgericht, Wien (Commercial Court, Vienna) and you further agree and expressly consent to the exercise of personal jurisdiction in the Handelsgericht Wien (Commercial Court, Vienna) in connection with any such dispute or claim. This Software License Agreement will not be governed by the conflict of law rules of any jurisdiction or the United Nations Convention on Contracts for the International Sale of Goods, the application of which is expressly excluded.

This Software License Agreement contains the entire agreement and understanding of the parties with respect to the subject matter hereof, and supersedes all prior written and oral understandings of the parties with respect to the subject matter hereof. Any notice or other communication given under this Software License Agreement shall be in writing and shall have been properly given by either of us to the other if sent by certified or registered mail, return receipt requested, or by overnight courier to the address shown on Altova's Web site for Altova and the address shown in Altova's records for you, or such other address as the parties may designate by notice given in the manner set forth above. This Software License Agreement will bind and inure to the benefit of the parties and our respective heirs, personal and legal representatives, affiliates, successors and permitted assigns. The failure of either of us at any time to require performance of any provision hereof shall in no manner affect such party's right at a later time to enforce the same or any other term of this Software License Agreement. This Software License Agreement may be amended only by a document in writing signed by both of us. In the event of a breach or threatened breach of this Software License Agreement by either party, the other shall have all applicable equitable as well as legal remedies. Each party is duly authorized and empowered to enter into and perform this Software License Agreement. If, for any reason, any provision of this Software License Agreement is held invalid or otherwise unenforceable, such invalidity or unenforceability shall not affect the remainder of this Software License Agreement, and this Software License Agreement shall continue in full force and effect to the fullest extent allowed by law. The parties knowingly and expressly consent to the foregoing terms and conditions.
