1 Introduction

The **Altova® European Banking Authority (EBA) XBRL Add-in for Excel** (or EBA Add-in for short) enables your organization to prepare XBRL reports that conform to the EBA (European Banking Authority) XBRL taxonomy or to related country-specific XBRL taxonomies.

The EBA XBRL Add-in allows you to do the following:

- Enter XBRL data in Microsoft Excel, using a predefined template spreadsheet which maps to the XBRL taxonomy
- Validate the report data directly from Excel to ensure it conforms to the XBRL taxonomy
- Export report data from Excel to XBRL format
- Import data from existing XBRL reports into Excel
- Batch convert XBRL files to Excel (.xlsx) format (*Enterprise Edition*)

The list of supported XBRL taxonomies is periodically updated to include newer versions, independently of Altova add-in releases. Country-specific XBRL taxonomies and older versions of the EBA XBRL taxonomy are not installed by default when you install the add-in. You can view, install, upgrade, and uninstall taxonomies on demand, using the [XBRL Taxonomy Manager](#)²⁶.

The EBA XBRL Add-in supports the EBA XBRL Taxonomy (starting with version 2.0 up to the most recent version) and country-specific taxonomies. The supported country-specific taxonomies are as follows:

- Banque de France (ACPR) COREP SUBCON - COREP, SubConsolidated (Prudential scope)
- Banque de France (ACPR) LCB FT
- Banco de Portugal (BdP) Reporting Framework
- Banco de Portugal (BdP) FINREP ITS
- Bank of England (BOE) Banking Taxonomy
- Bank of England (BOE) Banking Statistics Taxonomy
- Central Bank of Ireland (CBI)
- Deutsche Bundesbank (BBK)
- National Bank of Belgium (NBB) FINREP (Financial Reporting)
- National Bank of Belgium (NBB) TREP (Trading Reporting)
- Single Resolution Board (SRB) LTD (Liability Data Template)
- Single Resolution Board (SRB) RES
- Single Resolution Board (SRB) SRF

This documentation should be read in conjunction with the supporting documents included in the EBA XBRL Taxonomy:

- *Description of DPM formal model*
- *EBA Architecture for XBRL representation of DPM*
- *EBA XBRL Filing Rules*

Last updated: 12 April 2023

1.1 System Requirements

To install and run the add-in, note the following system requirements:

- Windows 7 SP1 with Platform Update, Windows 8, Windows 10, Windows 11, Windows Server 2008 R2 SP1 with Platform Update or newer
- Microsoft Excel 2010 and later
- If you use Excel 2010, [Visual Studio 2010 Tools for Office Runtime](#) must be installed
- .NET Framework 4.5 or later

Important

- The add-in is available for Microsoft Excel 32-bit and 64-bit. Microsoft Excel 64-bit is recommended if you need to load big taxonomies such as COREP CON, COREP IND, FINREP. Otherwise, you may see out-of-memory errors when attempting to load such taxonomies with Microsoft Excel 32-bit.
- The add-in requires full access to the Excel document in order to create, validate, and export XBRL reports. If your organization enforces Information Rights Management (IRM) using the Azure Information Protection or a similar technology, access to the Excel document may be restricted. For information about how to allow code to run behind documents with restricted permissions, see [the Microsoft documentation](#).

1.2 Installation and Licensing

To install the EBA XBRL Add-in, download the executable from the [Altova Download Center](#). Run the executable and follow the steps to complete the installation. You will need to accept the license agreement and privacy policy in order to proceed with the installation. Make sure to download the executable corresponding to your operating system and Excel platform (32-bit or 64-bit). The 32-bit executable can be installed on both 32-bit and 64-bit Windows. However, the 32-bit executable supports only Excel 32-bit. Note that if you have Excel 32-bit and install the 64-bit version of the add-in, you will still be running the 32-bit version.

After the installation, a new tab called **EBA** becomes available in the Excel ribbon. To view the current version of the add-in, open the **EBA** tab in the Excel ribbon and click **About EBA Add-In**.

Possible installation issues

After the installation of the add-in, when you first launch Excel, the add-in's DLL files are copied to `c:\Users\<UserName>\AppData\Local\assembly\d13`. The [Microsoft ASR rules](#) might block the execution of the DLL files from that location and the installation of the add-in. If you experience problems with the installation of the add-in, make sure to check group policies configured for your system.

Licensing

To use the EBA XBRL Add-in, you need a valid license key code. To purchase a new key code or request a free evaluation from the Altova website, take the following steps:

1. Click the **EBA** tab in the Excel ribbon.
2. Click **Add-In Activation**. You will see instructions on how to get a new license from Altova or manage an existing license.

After you purchase a license from Altova, follow the same steps as above to open the activation dialog box and upload the license file. Alternatively, you can upload the purchased licenses to [Altova LicenseServer](#) running on your organization's network. Altova LicenseServer is a free product that helps organizations manage all Altova licenses in a centralized place. See also [License Information](#) ⁴⁸.

2 Create a New Report

This section will help you get started with an EBA report. The section is organized into the following topics:

- [New Report](#) ¹⁰
- [Enter Data](#) ¹⁴
- [Enter Data into 3D Tables](#) ¹⁸
- [Control Accuracy of Cells](#) ²⁰
- [Validate Data](#) ²²
- [Export Data to XBRL](#) ²⁴
- [Import Data from XBRL](#) ²⁵

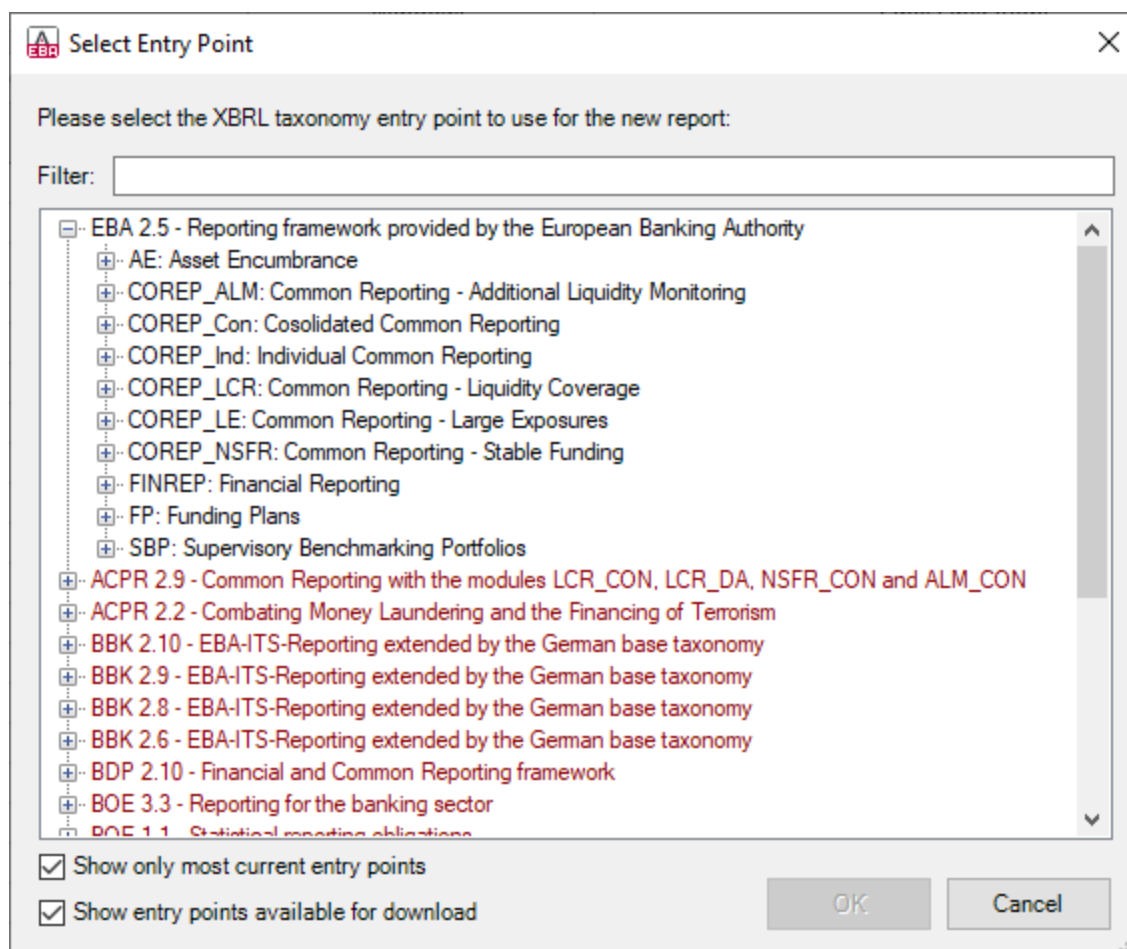

2.1 New Report

The instructions below show you how to prepare a new XBRL report based on the default EBA taxonomy available in EBA XBRL Add-in. This XBRL taxonomy is installed by default on your computer when you install the add-in. Additional taxonomies can be installed separately. For details, see [XBRL Taxonomy Manager](#)²⁶.

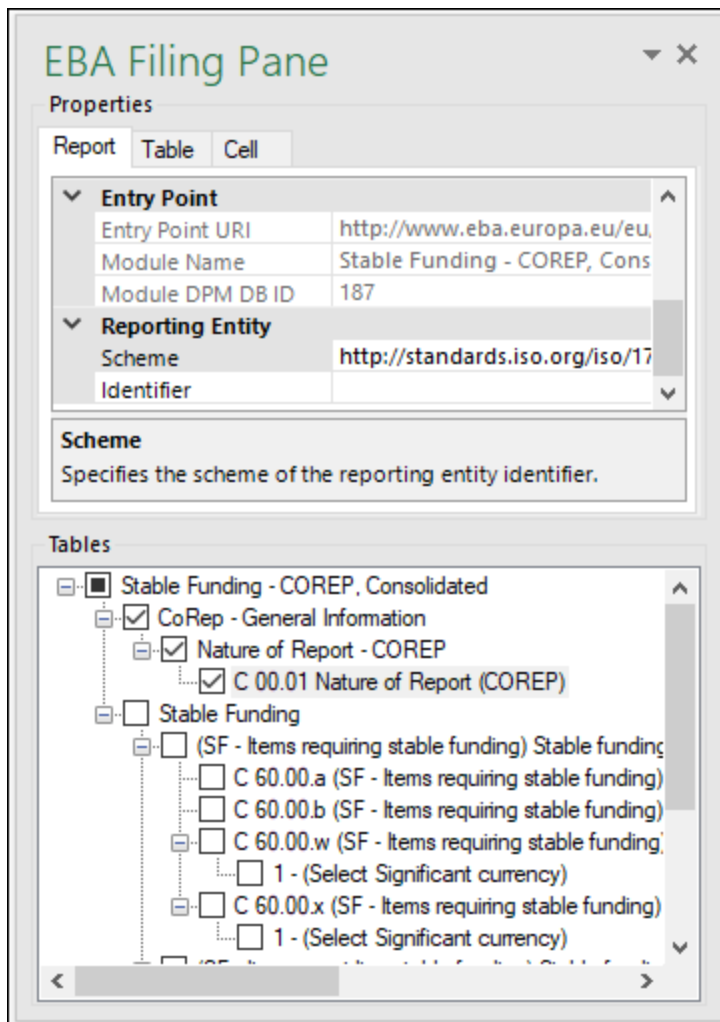

New report

To create a new report, take the following steps:

1. Click the EBA tab in the Excel ribbon.
2. Click **Insert New Report**.
3. Select the taxonomy entry point corresponding to the report you want to create (*see screenshot below*). Use the filter at the top of the dialog box to filter entry points by keywords. By default, only the most current entry points for the current version of the add-in are shown. To show all the XBRL taxonomies available for download, select the check box *Show entry points available for download*. To show all versions, clear this check box. Entry points shown in red are not installed. To install the respective XBRL taxonomies, select the entry point and click **OK**. This opens the XBRL Taxonomy Manager, where you can complete the installation. For more information, see [XBRL Taxonomy Manager](#)²⁶. Because of memory requirements, some entry points cannot be loaded in the 32-bit version of the add-in, in which case they appear as grayed out in the dialog box above. To make the loading of such entry points possible, use Excel 64-bit and install the 64-bit version of the add-in.

4. Wait while the report tables are loaded into Excel. During this operation, a dialog box informs you about the progress. Once the report tables have finished loading, notice the **Tables** section in the **EBA Filing Pane**.

5. Select the check boxes next to the tables you want to include in the report. Each included table appears on a new sheet in the Excel book. Please note that tables checked for inclusion will generate a true filing indicator, and tables that are left unchecked will generate a false filing indicator. The filing indicators are set by checking/unchecking the respective table in the **Tables** section of the pane. Each table that has been checked will be added to the report and set as filed; all the others will not be added to the report.

You can now start entering data in tables, validate it, and export it to XBRL format. See the following topics for more information:

- [Enter Data](#) ¹⁴
- [Control Accuracy of Cells](#) ²⁰
- [Validate Data](#) ²²
- [Export Data to XBRL](#) ²⁴

EBA Filing Pane

The **EBA Filing Pane** is the area where you can include or exclude tables from the report, view information about each cell, and view or set various report properties. By default, this pane is visible. You can show or hide

it by clicking the **Toggle EBA Filing Pane** command in the ribbon. As illustrated above, the **EBA Filing Pane** has two main sections: **Properties** and **Tables**, which are described in the subtopics below.

Properties

The properties displayed in the **EBA Filing Pane** directly affect the content of the XBRL instance file that will be created when you export the XBRL instance. To view what each property does, click it and observe the description displayed in the gray box under the grid. Grayed out properties are read-only. Otherwise, you can edit a property by typing text or selecting a value, as applicable.

The **Scheme** and **Identifier** properties under **Reporting Entity** are usually provided by the relevant competent authorities.

Also note that, even though some property values begin with **http** (for example, **XSD Entry Point URI**), they do not necessarily point to live web resources and thus should not be considered dead links. To resolve entry point URIs, the add-in uses a catalog mechanism that maps URIs to files on the local system. This is largely due to the size of the taxonomies and the fact that they contain thousands of files. Accessing the taxonomy files on the Internet would result in extremely slow performance, even if their issuing organizations served them that way.

Properties are grouped into the following three tabs:

- The **Report** tab displays properties applicable to the entire report: One report corresponds to one Excel workbook.
- The **Table** tab only displays properties of the currently selected table. A table normally corresponds to a single Excel worksheet. Therefore, whenever you click inside a new Excel sheet, the properties are re-drawn to reflect the new worksheet.
- The **Cell** tab displays only properties of the currently selected cell. Whenever you click a new cell, the cell properties are re-drawn accordingly.

You can set the accuracy-related properties at report, table, or cell level. For more information, see [Control Accuracy of Cells](#) ²⁰.

Tables

To include a table in the report, select its corresponding check box in the pane. Each included table appears on a new sheet in the Excel book. To go to a specific sheet, navigate to it using the standard Excel way or click the corresponding table in the **EBA Filing Pane**. To remove a particular table from the report, clear the check box next to it. Tables that are not selected will not be included in the report.

Some tables support a z-axis (a third dimension). For information about adding a z-axis to a table, see [Enter Data into 3D Tables](#) ¹⁸.

Each report table displayed in the **EBA Filing Pane** is XBRL-bound, which means that data you enter directly in the table cells will be reflected in the XBRL instance file when the report is ready. For more information, see [Export Data to XBRL](#) ²⁴. While the report data is work in progress, you can save the Excel workbook and reopen it later.

Any sheets that contain tables are bound to the XBRL taxonomy. Therefore, these tables must not be deleted. It is not recommended to rename such sheets. If necessary, you can add new sheets to the workbook. However, such sheets will not be bound to the XBRL taxonomy. As a result, these sheets will be ignored when you generate the XBRL instance file.

2.2 Enter Data

You can fill a report with data by entering data into cells manually or by pasting values. With some cells, you can select a value from a predefined list, such as countries or currencies. In some report tables, you may need to add new rows or columns. Below you will find information about how to enter data.

Editable vs. non-editable cells

As a general rule, gray cells must not be edited. Only cells that are included in the XBRL-bound area (delimited by the table boundaries) are to be edited. For guidance, with respect to the purpose of the cell and data to be entered, consult the cell information (properties) displayed in the **EBA Filing Pane** in the **Cell** tab.

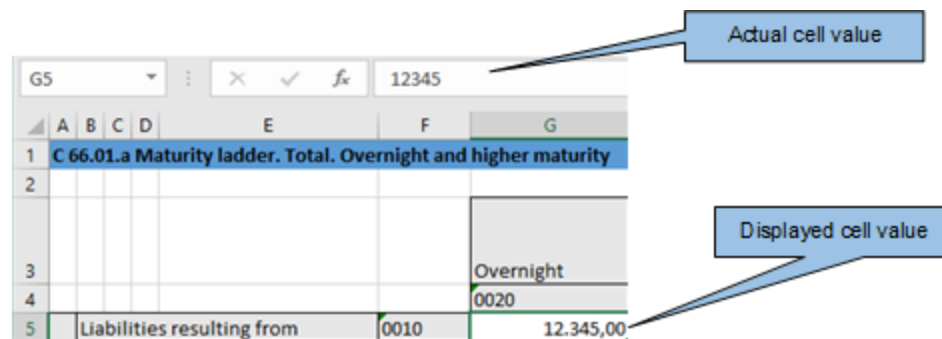

Pasting data

If you paste data from multiple columns, the number of pasted columns should correspond to the number of columns in the predefined sheet. If you accidentally paste a larger number of columns or type text outside the default table, unwanted columns may appear outside the XBRL-bound area. To delete the unwanted columns, right-click the cell and select **Delete | Table Columns**. To prevent Excel from adding new columns and rows automatically, go to **File | Options | Proofing | AutoCorrect Options | AutoFormat As You Type | Apply as you work** and click to clear the **Include new rows and columns in table** check box.

When you paste data, it is recommended to keep only the values but not the formatting, namely select the **Paste Values** option when pasting cells or rows.

Actual vs. displayed cell value

While generating the XBRL instance file, the add-in ignores any cell formatting information and exports the *actual* value of the Excel cell. However, bear in mind that the actual value may be different from the value displayed in the cell because of the cell formatting information. You can see the actual value that will be written to the XBRL instance in the formula bar of Excel (see *example below*).

In the example above, the value that will be written to the XBRL instance is 12345. Note that the number accuracy reported in the XBRL instance file also depends on the value you selected for the **Accuracy** properties. For more information about the accuracy of cells, see [Control Accuracy of Cells](#)²⁰.

Enumeration values

Some cells expect a fixed predetermined value (e.g., cells that represent currencies or countries). In this case, the add-in displays a small tooltip when you click the cell. You can choose the required value from the drop-down list:

	A	B	C	D	E	F	G	H	
1	F 34.00.c (AE-CONT) Asset encumbrance: Contingent encumbr								
2									
3	Sheet per Significant currency								
4									
5									

Contingent Encumbrance

B. Net ef

Select Significant currency
Please select a value from the list.

To view the full list of all possible values, click the cell and see the cell properties in the **Cell** tab of the **EBA Filing Pane**.

Conditional cells

In some tables, you must first fill out a cell value in order to make other cells of the table editable. For example, cell F3 must be filled out before all other cells in the same column can be edited (see *screenshot below*).

	A	B	C	D	E	F	G	H
1	F 34.00.c (AE-CONT) Asset encumbrance: Contingent encumbr							
2								
3	Sheet per Significant currency							
4								
5						Continge Encumbr		
6						B. Net ef 10% depreciation of significant currencies		
7						Additional amount of encumbered assets		
8						026		
9	Carrying amount of selected				010			
10	Derivatives				020			
11	of which: Over-The-				030			
12	Deposits				040			
13	Repurchase agreements				050			
14	of which: central banks				060			
15	Collateralised deposits				070			
16	of which: central banks				080			
17	Debt securities issued				090			

Select Significant currency
Please select a value from the list.

Cells with multiple values

Depending on the XBRL taxonomy, some reports might have facts that represent a list of comma-separated multiple values. As a result, the corresponding cell also requires multiple values to be entered in the same cell.

To enter data for such cells, expand the drop-down list and click all the relevant items. Alternatively, you can type all the numeric values, separated by a comma (*see screenshot below*). Remember that you can view all possible values of a cell in the **Cell** tab of the **EBA FilingPane**.

	A	B	C
1	S.25.01.21.03 Basic Solvency Capital Requirement (U\$		
2			
3			USP
4			C0090
5	Life underwriting risk	R0030	
6	Health underwriting risk	R0040	2,3
7	Non-life underwriting risk	R0050	

After you exit the cell with multiple values, it is automatically re-drawn to display all selected values in a readable form (even though you may have entered only numbers).

New rows

With some tables, you may need to create new rows. For example, this is the case for **Table C 10.02** available through the entry point **EBA 2.6 COREP CON**. You can add new rows using the standard Excel commands or shortcuts. Alternatively, you can click the **Add Row** button in the ribbon. For example, to add a new row to **Table C 10.02** of the entry point mentioned above, do one of the following:

- Click the **EBA** tab in the Excel ribbon. Then click **Add Row | Insert Row Below**. Note that the commands to insert or delete rows are enabled only if the table supports adding new rows.
- Click the rightmost cell of the last row in the table and press **Tab**.
- Right-click a cell in the empty row and select **Insert | Table Row Below** from the context menu.

Note: Any newly added rows must be within the XBRL-bound area of the table, clearly delimited by black lines.

New columns

For some tables, you may need to add extra columns, which means these tables can grow horizontally. You can add new columns to such tables in one of the following ways:

- In the Excel ribbon, click the **EBA** tab. Then click **Add Column**. Note that this command is enabled only if the table supports adding new columns according to the XBRL taxonomy.
- Click the **Add** button that appears next to the rightmost column of a table.
- Right-click a table cell and select **Insert | Table Columns to the Right** from the context menu.

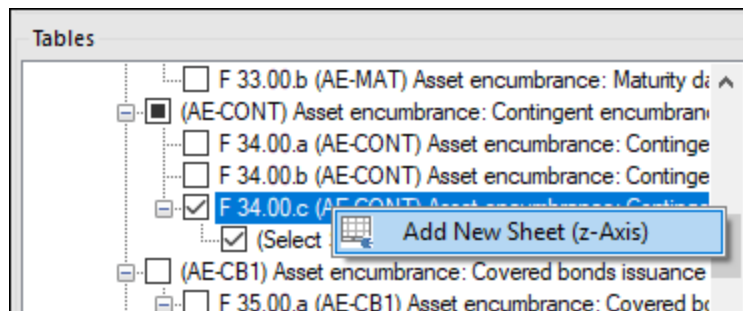

2.3 Enter Data into 3D Tables

Most of the report tables have only two dimensions: the x-axis (columns) and the y-axis (rows). However, there are some tables where you may need to enter data into a third dimension (the z-axis): e.g., **Table F 34.00.c (AE CON)** available through the entry point **AE CON: Asset Encumbrance, Consolidated**. This table may need an additional sheet for each currency. As shown below, cell F3 is a drop-down list from which you can select a currency.

	A	B	C	D	E	F	G	H
1	F 34.00.c (AE-CONT) Asset encumbrance: Contingent encumbr							
2								
3	Sheet per Significant currency							
4								
5						Continge Encumbr B. Net ef		

In cases such as the one above, you can add a new sheet along the z-axis (third dimension) of the table as follows:

1. Click the **EBA** tab in the Excel ribbon.
2. Click the **Add Sheet (z-Axis)** button. Note that the commands to insert or delete new z-axis sheets are enabled only if the table supports adding the z-axis.
3. Alternatively, right-click the table in the **EBA Filing Pane**. Then select **Add New Sheet (z-Axis)** from the context menu (see screenshot below). This creates a new sheet that displays the third dimension of the table (z-axis). The sheet representing the z-axis always has an indicative name that resembles the original table.

Data from the third dimension (z-axis) of a table is displayed as new sheets in Excel. Therefore, three-dimensional tables span across more than one sheet. This is an exception to the rule that one Excel sheet corresponds to one table in the XBRL report. In the XBRL instance, data that belongs to the z-axis will be, however, correctly reported as part of the same table.

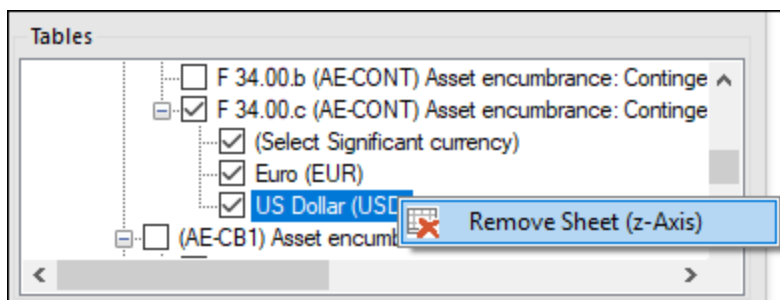

When you click a cell that represents the z-axis, all the possible values for the drop-down list are displayed in the **Cell** tab of the **EBA Filing Pane** (see screenshot below).

Dimension	
Name	CUS
Label	Currency with significant liability
Verbose Label	Defines the currencies of the si
DPM DB ID	775
Type	enumeration
Possible Values	
Afghani (AFN)	eba_CU:AFN
Algerian Dinar (DZD)	eba_CU:DZD
Argentine Peso (ARS)	eba_CU:ARS
Armenian Dram (AMD)	eba_CU:AMD
Aruban Florin (AWG)	eba_CU:AWG
Australian Dollar (AUD)	eba_CU:AUD

Delete z-Axis sheets

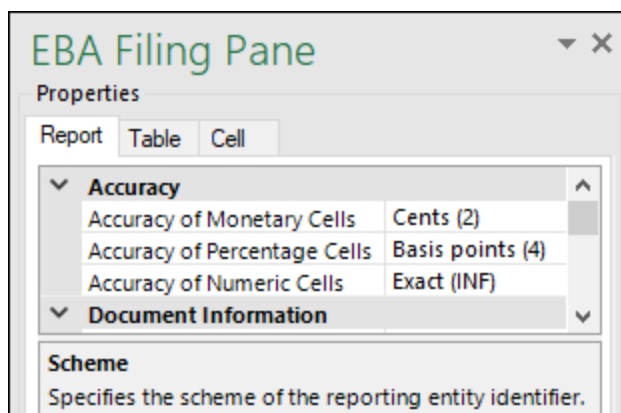

You can delete sheets that contain data from the third dimension (z-axis) as follows:

1. Select the required sheet or click the corresponding entry in the **Tables** section of the **EBA Filing Pane**.
2. Click **Remove Sheet (z-Axis)** in the **EBA** tab. Alternatively, right-click the table in the **EBA Filing Pane** and select **Remove Sheet (z-Axis)** from the context menu (see screenshot below).

2.4 Control Accuracy of Cells

You can control the accuracy of monetary and other numeric values in the XBRL report by setting the accuracy of monetary cells, numeric cells, and percentage cells. These properties are available in the **EBA Filing Pane** in the **Properties** section.

Accuracy of monetary cells

The property **Accuracy of Monetary Cells** applies to numeric cells that represent a monetary value. For example, if you select entry point *FP IND: Funding Plans, Individual, Table P 01.03*, this property affects all cells of type `monetaryItemType`. By default, the property **Accuracy of Monetary Cells** is set to *Cents (2)*, which sets the value of the `decimals` attribute in the XBRL instance to 2.

Accuracy of numeric cells

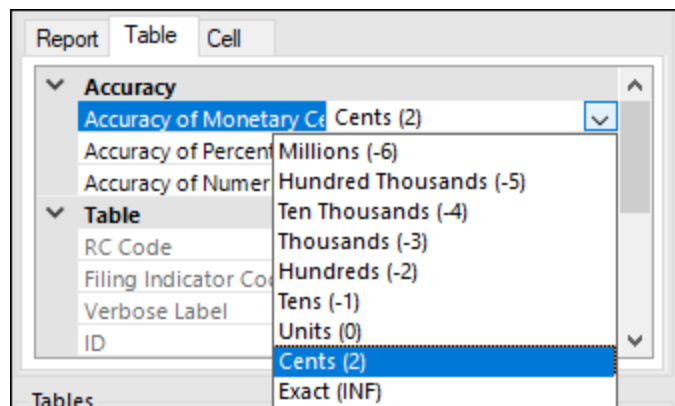

The property **Accuracy of Numeric Cells** applies to numeric values that have no unit except for percentage values, which have their own data type. For example, if you select entry point *SPB CON, Table C 101.00*, this property affects the column **Maturity (160)**. By default, the property **Accuracy of Numeric Cells** is set to *Exact (INF)*, which sets the value of the `decimals` attribute in the XBRL instance to INF.

Accuracy of percentage cells

The property **Accuracy of Percentage Cells** applies to values that represent a percentage. For example, if you select the entry point *FP IND: Funding Plans, Individual, Table P 01.03*, this property affects all cells of type `percentItemType`. By default, the property **Accuracy of Percentage Cells** is set to *Basis Points (4)*, which sets the value of the `decimals` attribute in the XBRL instance to 4.

To see the type of a cell, select a cell and click the **Cell** tab in the **EBA Filing Pane** and see the **Type** property.

The accuracy you select from the **EBA Filing Pane** controls the accuracy that will be written for this fact in the XBRL instance file. More specifically, the **Accuracy** properties are bound to the `decimals` attribute in the XBRL instance file. In the screenshot below, the accuracy value indicated in the brackets corresponds to the value of the `decimals` attribute in the XBRL instance file.

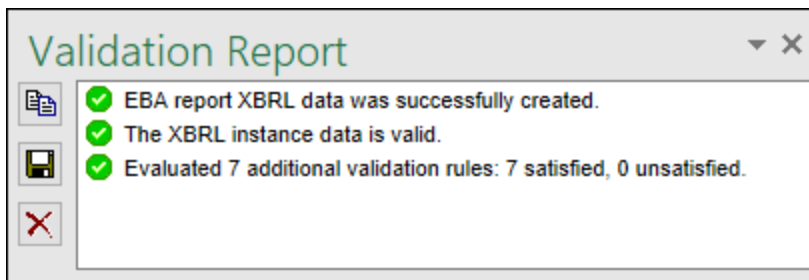

You can set the accuracy-related properties at report, table, or cell level (see *screenshot above*). If you set accuracy at multiple levels, keep in mind that the more specific property always overrides the more generic one. For example, the accuracy set at cell level takes priority over the one set at table level. Likewise, the accuracy set at table level takes priority over the one set at report level.

For monetary and numeric cells, the accuracy value can be positive or negative. A positive value N specifies the accuracy of up to N digits to the right of the decimal separator. For example, the value 2 specifies the accuracy of monetary cells to be in cents. A negative value N specifies the accuracy of up to N digits to the left of the decimal separator. For example, the value -3 specifies the accuracy to be up to thousands, while the value -6 specifies the accuracy to be up to millions.

2.5 Validate Data

Validation ensures that the XBRL data you are filing conforms to the XBRL specification. It is essential that you validate your report data before exporting it. To validate data, click the **Validate** button in the add-in tab of the Excel ribbon. When the validation of the instance finishes, a validation report similar to the one below is displayed.

When the validation fails, the **Validation Report** window may display links to the cell where the error occurred. To quickly find a cell with the error, click the underlined text, and the cursor will be positioned automatically on the required cell. Note that there are cases where multiple cells are involved in a single validation check. In such cases, clicking on the error link will select one of the affected cells.

Validation results

The validation result can contain any of the following validation messages:

Message type	Meaning
	The instance data is valid.
	The instance data is valid but has inconsistencies or warnings.
	The instance data is not valid.

Information messages, warnings, and errors

The **Validation Report** dialog box may additionally display any of the following message types: information messages, warnings, and errors.

Message type	Meaning
	This is an information message. Information messages do not make the XBRL instance invalid.
	This is a warning message or an inconsistency. Warnings and inconsistencies do not make the XBRL instance invalid.
	Indicates an error. If there are validation errors, the XBRL instance is not valid. In this case, you will need to edit the report data to correct each error before exporting to XBRL.

Message type	Meaning
	During validation, the add-in checks XBRL formula assertions and reports them as errors. If you are using Altova RaptorXML+XBRL Server for validation, XBRL formula assertions may be optionally configured not to be reported as errors.

Note: By default, the add-in treats invalid cell values as errors. If necessary, you can configure the add-in to treat invalid cell values as warnings instead. For more information, see [Settings](#) ⁴⁶.

Copy, save, clear

To copy the contents of the validation report to the clipboard, click  and paste it into a target file (e.g., an email). Alternatively, right-click inside the **Validation Report** window and select **Copy All Messages** from the context menu.

To save the validation report as text or HTML, click . Alternatively, right-click inside the **Validation Report** window and select **Save Validation Report** from the context menu.

To clear the validation report, click . Alternatively, right-click inside the **Validation Report** window and select **Clear** from the context menu.

2.6 Export Data to XBRL

Once your report is ready and valid, you can generate an XBRL instance file. To do this, click **Export to XBRL** in the add-in ribbon. By default, instance files are saved with a `.xbr1` extension. If you need the exported file to have another extension (for example, `.xml`), type the file extension in the **Export** dialog box.

During the export, data is automatically validated. Any errors, inconsistencies and warnings are reported on the screen after the export finishes. For more information, see [Validate Data](#)²².

Note: Cell values that are not valid, that is, cells that do not conform to the data type of the underlying XBRL concept, prevent the report from being exported.

For tips on how to avoid data formatting errors, see [Enter Data](#)¹⁴. Note, however, that not all XBRL validation errors might be related to incorrect formatting. Some errors might occur because entered data does not meet the XBRL validation rules applicable to the report you are filing.

2.7 Import Data from XBRL

You can import data from existing instances of XBRL reports into Excel (typically, files with a `.xbrl` extension). For the import to be successful, the imported instances must be valid XBRL reports. They may be reports you have previously generated using the **EBA XBRL Add-in** or reports that you received from other parties.

To import an existing XBRL instance file into Excel, follow the instructions below:

1. In the Excel ribbon, click the **EBA** tab.
2. Click **Import from XBRL** and browse for the XBRL instance file.

Note: If a report is already open in Excel, the **Import from XBRL** button is disabled. To enable the command, save and close the current report (workbook) and create a new workbook.

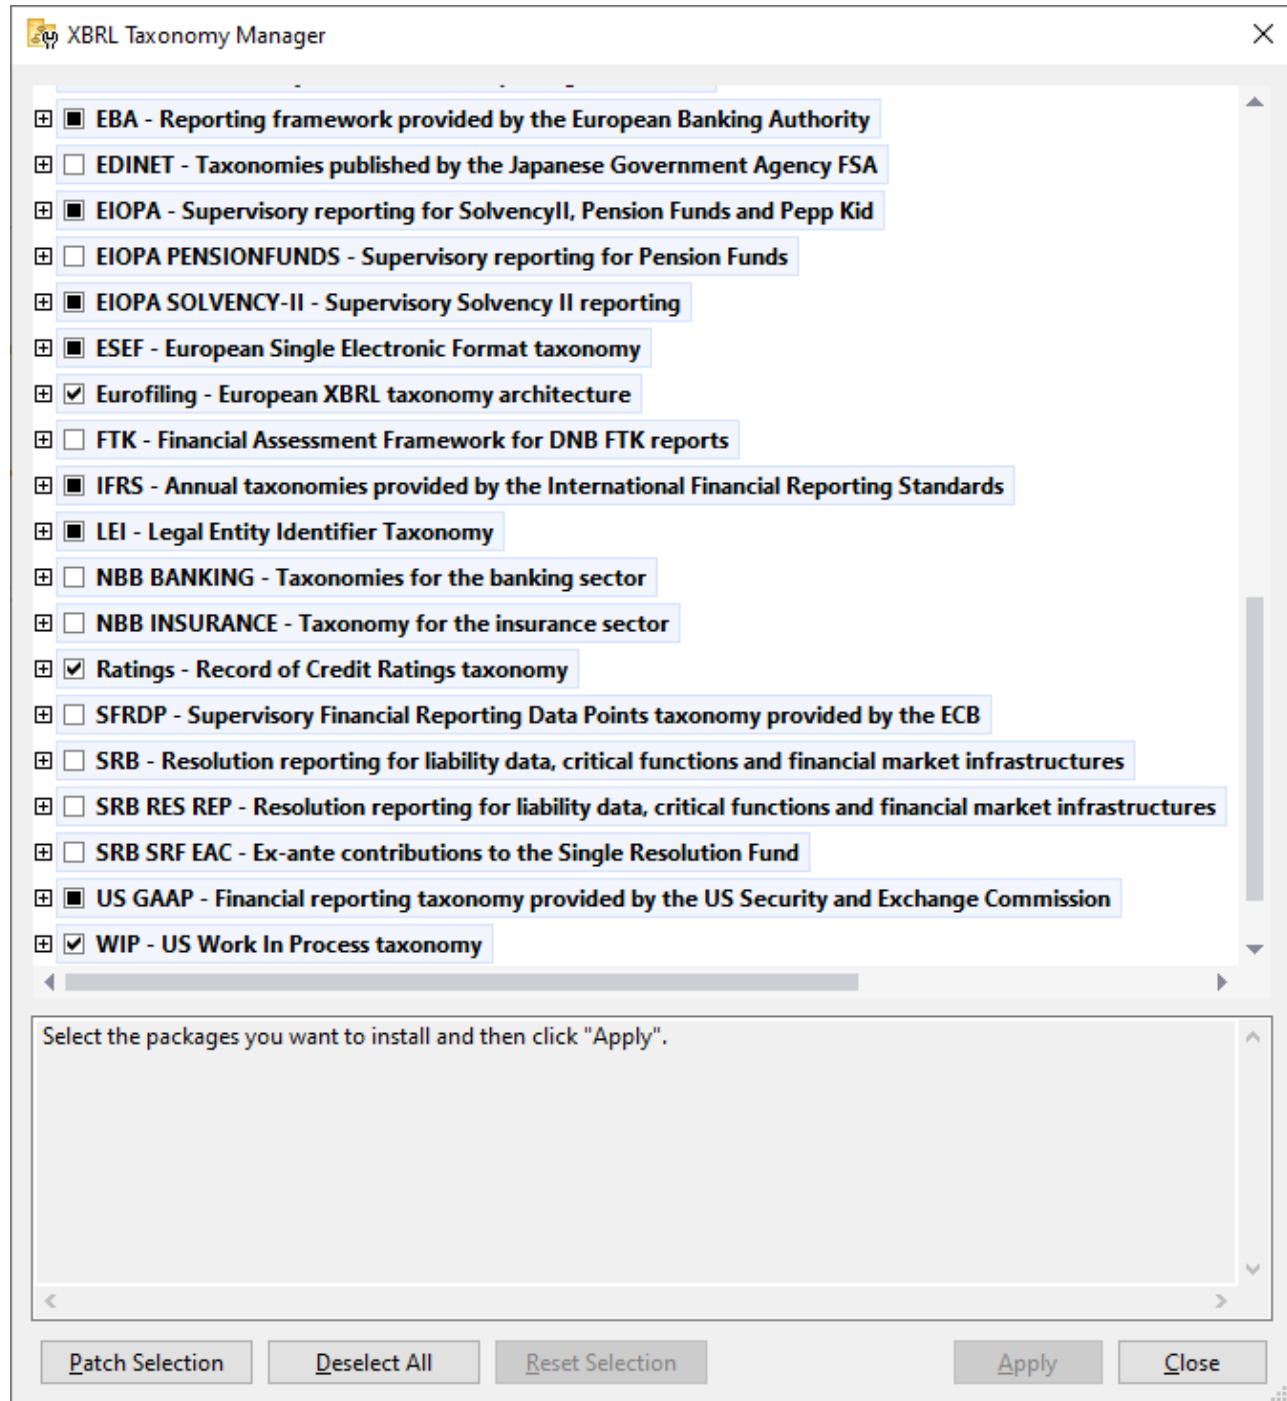

During the import operation, the **Importing XBRL report** dialog box informs you about the progress. While the report data is loaded into Excel, it is automatically validated. The dialog box notifies you about potential warnings, inconsistencies, and/or errors. For more information, see [Validate Data](#)²².

Note: During the import, the add-in validates XBRL formula assertions. The report will be imported even if it contains unsatisfied assertions.

3 Taxonomy Manager

XBRL Taxonomy Manager is an Altova tool that provides a centralized way to install and manage XBRL taxonomies for use across all Altova's XBRL-enabled applications, including EBA XBRL Add-in.

- On Windows, Taxonomy Manager has a graphical user interface (*screenshot below*) and is also available at the command line. (Altova's desktop applications are available on Windows only; *see list below*.)
- On Linux and macOS, Taxonomy Manager is available at the command line only. (Altova's server applications are available on Windows, Linux, and macOS; *see list below*.)

Altova's XBRL-enabled applications

Desktop applications (Windows only)	Server applications (Windows, Linux, macOS)
Altova XBRL Add-ins for Excel (EBA, ESEF, Solvency II)	MapForce Server (Standard and Advanced Editions)

MapForce Enterprise Edition	RaptorXML+XBRL Server
StyleVision Enterprise Edition	StyleVision Server
XMLSpy Enterprise Edition	

Installation and de-installation of Taxonomy Manager

Taxonomy Manager is installed automatically when you first install a new version of Altova Mission Kit Enterprise Edition or of any of Altova's XBRL-enabled applications (*see table above*).

Likewise, it is removed automatically when you uninstall the last Altova XBRL-enabled application from your computer.

Taxonomy Manager features

Taxonomy Manager provides the following features:

- Shows XBRL taxonomies installed on your computer and checks whether new versions are available for download.
- Downloads newer versions of XBRL taxonomies independently of the Altova product release cycle. (Altova stores taxonomies online, and you can download them via Taxonomy Manager.)
- Install or uninstall any of the multiple versions of a given taxonomy (or all versions if necessary).
- An XBRL taxonomy may have dependencies on other taxonomies. When you install or uninstall a particular taxonomy, Taxonomy Manager informs you about dependent taxonomies and will automatically install or remove them as well.
- Taxonomy Manager uses the [XML catalog](#) mechanism to map schema references to local files. In the case of large XBRL taxonomies, processing will therefore be faster than if the taxonomies were at a remote location.
- All major taxonomies are available via Taxonomy Manager and are regularly updated for the latest versions. This provides you with a convenient single resource for managing all your taxonomies and making them readily available to all of Altova's XBRL-enabled applications.
- Changes made in Taxonomy Manager take effect for all Altova products installed on that machine.

How it works

Altova stores all XBRL taxonomies used in Altova products online. This repository is updated when new versions of the taxonomies are released. Taxonomy Manager displays information about the latest available taxonomies when invoked in both its GUI form as well as on the CLI. You can then install, upgrade or uninstall taxonomies via Taxonomy Manager.

Taxonomy Manager also installs taxonomies in one other way. At the Altova website (<https://www.altova.com/taxonomy-manager>) you can select a taxonomy and its dependent taxonomies that you want to install. The website will prepare a file of type `.altova_taxonomies` for download that contains information about your taxonomy selection. When you double-click this file or pass it to Taxonomy Manager via the CLI as an argument of the `install` ⁴⁰ command, Taxonomy Manager will install the taxonomies you selected.

Local cache: tracking your taxonomies

All information about installed taxonomies is tracked in a centralized cache directory on your computer, located here:

<i>Windows</i>	C:\ProgramData\Altova\pkgs\.cache
<i>Linux</i>	/var/opt/Altova/pkgs\.cache
<i>macOS</i>	/var/Altova/pkgs

This cache directory is updated regularly with the latest status of taxonomies at Altova's online storage. These updates are carried out at the following times:

- Every time you start Taxonomy Manager.
- When you start EBA XBRL Add-in for the first time on a given calendar day.
- If EBA XBRL Add-in is open for more than 24 hours, the cache is updated every 24 hours.
- You can also update the cache by running the [update](#)⁴³ command at the command line interface.

The cache therefore enables Taxonomy Manager to continuously track your installed taxonomies against the taxonomies available online at the Altova website.

Do not modify the cache manually!

The local cache directory is maintained automatically based on the taxonomies you install and uninstall. It should not be altered or deleted manually. If you ever need to reset Taxonomy Manager to its original "pristine" state, then, on the command line interface (CLI): (i) run the [reset](#)⁴¹ command, and (ii) run the [initialize](#)³⁹ command. (Alternatively, run the `reset` command with the `--i` option.)

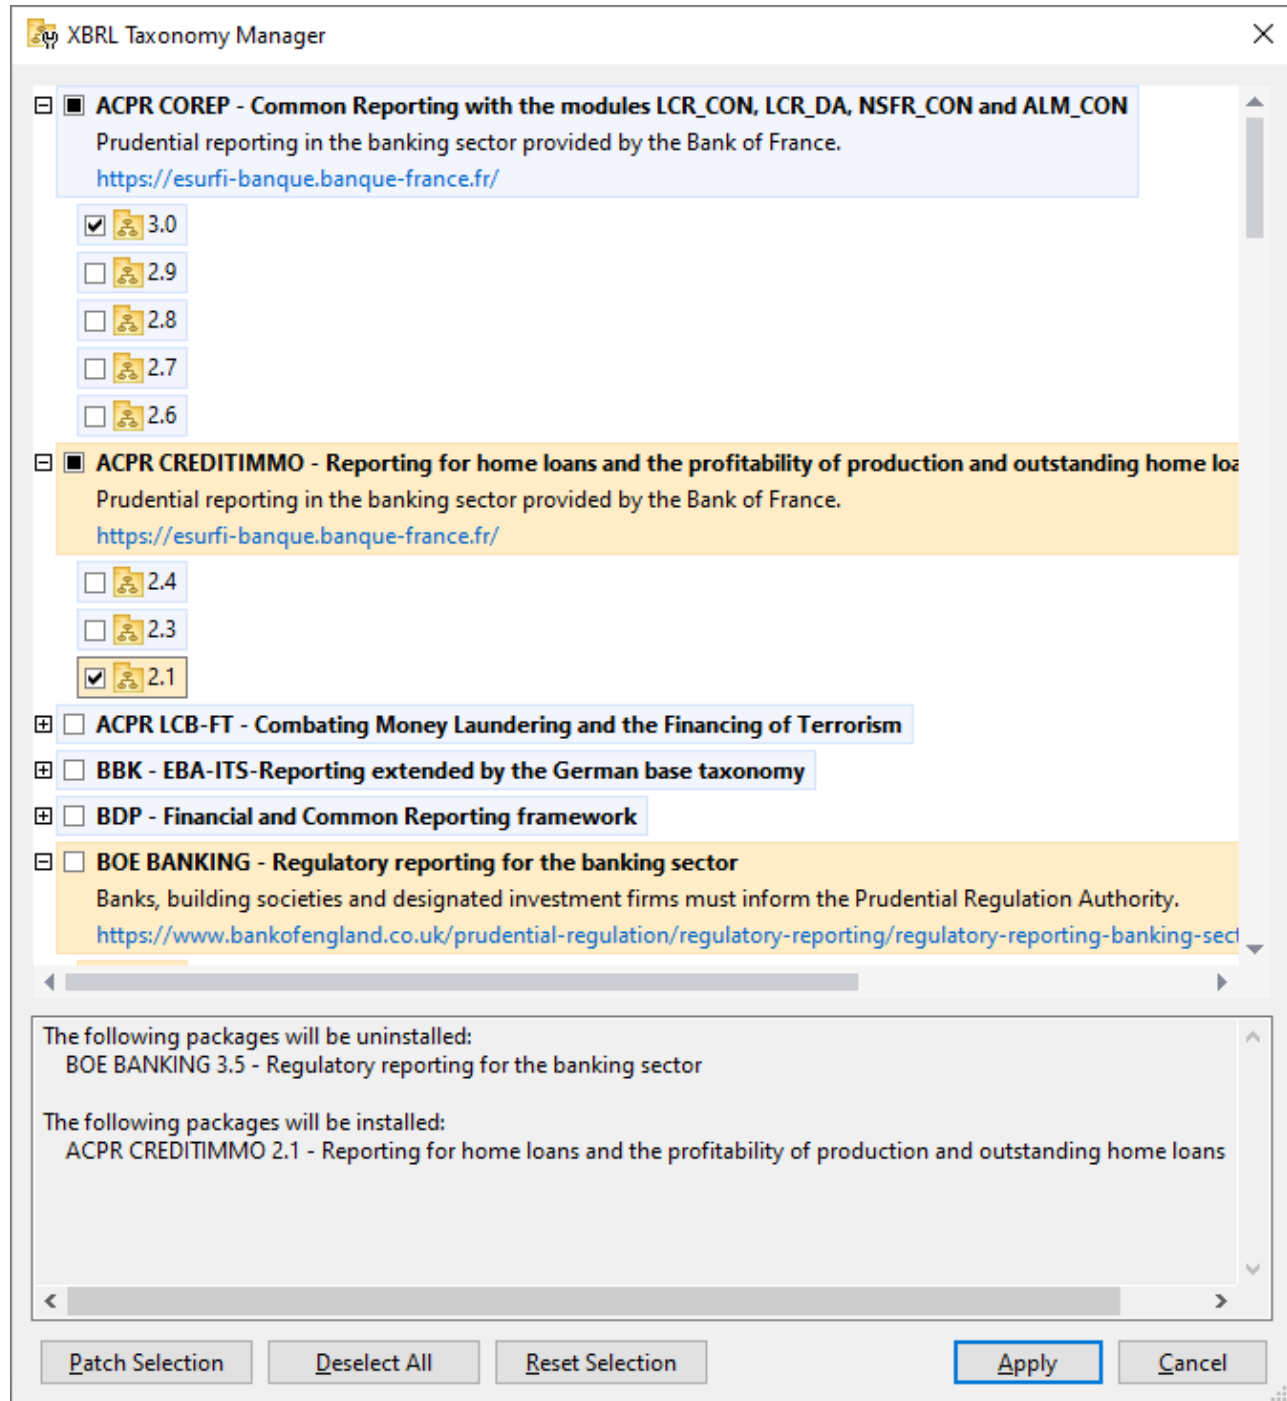

3.1 Run Taxonomy Manager

Graphical User Interface

You can access the GUI of Taxonomy Manager in any of the following ways:

- *During the installation of EBA XBRL Add-in:* Towards the end of the installation procedure, select the check box *Invoke Altova Taxonomy Manager* to access the XBRL Taxonomy Manager GUI straight away. This will enable you to install taxonomies during the installation process of your Altova application.
- *After the installation of EBA XBRL Add-in:* After your application has been installed, you can access the Taxonomy Manager GUI at any time, by clicking **Manage Taxonomies** in the add-in ribbon.
- Via the `.altova_taxonomies` file downloaded from the [Altova's XBRL Taxonomy Download Center](#): Double-click the downloaded file to run the Taxonomy Manager GUI, which will be set up to install the taxonomies you selected (at the website) for installation. (To open Altova's online XBRL Taxonomy Download Center in your browser and select the taxonomies you want to install, click **Altova on the Web | Taxonomy Download** in the add-in ribbon.)

After the Taxonomy Manager GUI (*screenshot below*) has been opened, already installed taxonomies will be shown selected. If you want to install an additional taxonomy, select it. If you want to uninstall an already installed taxonomy, deselect it. After you have made your selections and/or deselections, you are ready to apply your changes. The taxonomies that will be installed or uninstalled will be highlighted and a message about the upcoming changes will be posted to the Messages pane at the bottom of the Taxonomy Manager window (*see screenshot*).

Command line interface

You can run Taxonomy Manager from a command line interface by sending commands to its executable file, `taxonomymanager.exe`.

The `taxonomymanager.exe` file is located in the following folder:

- *On Windows:* `C:\ProgramData\Altova\SharedBetweenVersions`
- *On Linux or macOS (server applications only):* `%INSTALLDIR%/bin`, where `%INSTALLDIR%` is the program's installation directory.

You can then use any of the commands listed in the CLI command reference section.

To display help for the commands, run the following:

- *On Windows:* `taxonomymanager.exe --help`
- *On Linux or macOS (server applications only):* `sudo ./taxonomymanager --help`

3.2 Status Categories

Taxonomy Manager categorizes the taxonomies under its management as follows:

- *Installed taxonomies.* These are shown in the GUI with their check boxes selected (*in the screenshot below the checked versions of the DNB and EBA taxonomies are installed taxonomies*). If all the versions of a taxonomy are selected, then the selection mark is a tick. If at least one version is unselected, then the selection mark is a solid colored square. You can deselect an installed taxonomy to **uninstall** it.
- *Uninstalled available taxonomies.* These are shown in the GUI with their check boxes unselected. You can select the taxonomies you want to **install**.

- *Upgradeable taxonomies* are those which have been revised by their issuers since they were installed. They are indicated in the GUI by a  icon (see screenshot above). You can **patch** an installed taxonomy with an available revision.

Points to note

- In the screenshot above, both DNB taxonomies and some of the EBA taxonomies are checked. Those with the blue background are already installed. Those with the yellow background are uninstalled and have been selected for installation. Note that (i) the EBA 2.10 Phase 2 taxonomy is not installed and has not been selected for installation, (ii) the EBA 3.1 Phase 2 taxonomy has been installed, but it has been patched by its issuer since it was installed and the patch has not yet been installed.
- When running Taxonomy Manager from the command line, the `list` ⁴⁰ command is used with different options to list different categories of taxonomies:

<code>taxonomymanager.exe list</code>	Lists all installed and available taxonomies; upgradeables are also indicated
---------------------------------------	---

<code>taxonomymanager.exe list -i</code>	Lists installed taxonomies only; upgradeables are also indicated
<code>taxonomymanager.exe list -u</code>	Lists upgradeable taxonomies

Note: On Linux and macOS, use `sudo ./taxonomymanager list`

3.3 Patch or Install a Taxonomy

Patch an installed taxonomy

Occasionally, XBRL taxonomies may receive patches (upgrades or revisions) from their issuers. When Taxonomy Manager detects that patches are available, these are indicated in the taxonomy listings of Taxonomy Manager and you can install the patches quickly.

In the GUI

Patches are indicated by the 📄🚨 icon. (Also see the previous topic about [status categories](#) ³³.) If patches are available, the **Patch Selection** button will be enabled. Click it to select and prepare all patches for installation. In the GUI, the icon of each taxonomy that will be patched changes from 📄🚨 to 📄📈, and the Messages pane at the bottom of the dialog lists the patches that will be applied. When you are ready to install the selected patches, click **Apply**. All patches will be applied together. Note that if you deselect a taxonomy marked for patching, you will actually be uninstalling that taxonomy.

On the CLI

To apply a patch at the command line interface:

1. Run the `list -u` ⁴⁰ command. This lists any taxonomies where patch upgrades are available.
2. Run the `upgrade` ⁴³ command to install all the patches.

Install an available taxonomy

You can install taxonomies using either the Taxonomy Manager GUI or by sending Taxonomy Manager the install instructions via the command line.

Note: If the current taxonomy references other taxonomies, the referenced taxonomies are also installed.

In the GUI

To install taxonomies using the Taxonomy Manager GUI, select the taxonomies you want to install and click **Apply**.

You can also select the taxonomies you want to install at the [Altova website](#) and generate a downloadable `.altova_taxonomies` file. When you double-click this file, it will open Taxonomy Manager with the taxonomies you wanted pre-selected. All you will now have to do is click **Apply**.

On the CLI

To install taxonomies via the command line, run the `install` ⁴⁰ command:

```
taxonomymanager.exe install [options] Taxonomy+
```

where `Taxonomy` is the taxonomy (or taxonomies) you want to install or a `.altova_taxonomies` file. A taxonomy is referenced by an identifier of format `<name>-<version>`. (The identifiers of taxonomies are displayed when you run the `list` ⁴⁰ command.) You can enter as many taxonomies as you like. For details, see the description of the `install` ⁴⁰ command.

Note: On Linux or macOS, use the `sudo ./taxonomymanager` command.

Installing a required taxonomy

When you run an XBRL-related command in EBA XBRL Add-in and EBA XBRL Add-in discovers that a taxonomy it needs for executing the command is not present or is incomplete, Taxonomy Manager will display information about the missing taxonomy. You can then directly install any missing taxonomy via Taxonomy Manager.

In the Taxonomy Manager GUI, you can view all previously installed taxonomies at any time by running Taxonomy Manager from **Tools | Taxonomy Manager**.

3.4 Uninstall a Taxonomy, Reset

Uninstall a taxonomy

You can uninstall taxonomies using either the Taxonomy Manager GUI or by sending Taxonomy Manager the uninstall instructions via the command line.

Note: If the taxonomy you want to uninstall references other taxonomies, then the referenced taxonomies are also uninstalled.

In the GUI

To uninstall taxonomies in the Taxonomy Manager GUI, clear their check boxes and click **Apply**. The selected taxonomies and their referenced taxonomies will be uninstalled.

To uninstall all taxonomies, click **Deselect All** and click **Apply**.

On the CLI

To uninstall taxonomies via the command line, run the `uninstall` command:

```
taxonomymanager.exe uninstall [options] Taxonomy+
```

where each `Taxonomy` argument is a taxonomy you want to uninstall or a `.altova_taxonomies` file. A taxonomy is specified by an identifier that has a format of `<name>-<version>`. (The identifiers of taxonomies are displayed when you run the `list`⁴⁰ command.) You can enter as many taxonomies as you like. For details, see the description of the `uninstall`⁴² command.

Note: On Linux or macOS, use the `sudo ./taxonomymanager` command.

Reset Taxonomy Manager

You can reset Taxonomy Manager. This removes all installed taxonomies and the cache directory.

- In the GUI, click **Reset Selection**.
- On the CLI, run the `reset`⁴¹ command.

After running this command, make sure to run the `initialize`³⁹ command in order to recreate the cache directory. Alternatively, run the `reset`⁴¹ command with the `-i` option.

Note that `reset -i`⁴¹ restores the original installation of the product, so it is recommended that you run the `update`⁴³ command after performing a reset. Alternatively, run the `reset`⁴¹ command with the `-i` and `-u` options.

3.5 Command Line Interface (CLI)

To call Taxonomy Manager at the command line, you need to know the path of the executable. By default, the Taxonomy Manager executable is installed here:

```
C:\ProgramData\Altova\SharedBetweenVersions\TaxonomyManager.exe
```

Note: On Linux and macOS systems, once you have changed the directory to that containing the executable, you can call the executable with `sudo ./taxonomymanager`. The prefix `./` indicates that the executable is in the current directory. The prefix `sudo` indicates that the command must be run with root privileges.

Command line syntax

The general syntax for using the command line is as follows:

```
<exec> -h | --help | --version | <command> [options] [arguments]
```

In the listing above, the vertical bar `|` separates a set of mutually exclusive items. The square brackets `[]` indicate optional items. Essentially, you can type the executable path followed by either `--h`, `--help`, or `--version` options, or by a command. Each command may have options and arguments. The list of commands is described in the following sections.

3.5.1 help

This command provides contextual help about commands pertaining to Taxonomy Manager executable.

Syntax

```
<exec> help [command]
```

Where `[command]` is an optional argument which specifies any valid command name.

Note the following:

- You can invoke help for a command by typing the command followed by `-h` or `--help`, for example:
`<exec> list -h`
- If you type `-h` or `--help` directly after the executable and before a command, you will get general help (not help for the command), for example: `<exec> -h list`

Example

The following command displays help about the `list` command:

```
taxonomymanager help list
```

3.5.2 info

This command displays detailed information for each of the taxonomies supplied as a `Taxonomy` argument. This information for each submitted taxonomy includes the title, version, description, publisher, and any dependent taxonomies, as well as whether the taxonomy has been installed or not.

Syntax

```
<exec> info [options] Taxonomy+
```

- The `Taxonomy` argument is the name of a taxonomy or a part of a taxonomy's name. (To display a taxonomy's package ID and detailed information about its installation status, you should use the [list](#) ⁴⁰ command.)
- Use `<exec> info -h` to display help for the command.

Example

The following command displays information about the `eba-2.1.0` and `us-gaap-2020.0` taxonomies:

```
taxonomymanager info eba-2.1.0 us-gaap-2020.0
```

3.5.3 initialize

This command initializes the Taxonomy Manager environment. It creates a cache directory where information about all taxonomies is stored. Initialization is performed automatically the first time an XBRL-enabled Altova application is installed. You would not need to run this command under normal circumstances, but you would typically need to run it after executing the `reset` command.

Syntax

```
<exec> initialize | init [options]
```

Options

The `initialize` command takes the following options:

<code>--silent, --s</code>	Display only error messages. The default is <code>false</code> .
<code>--verbose, --v</code>	Display detailed information during execution. The default is <code>false</code> .
<code>--help, --h</code>	Display help for the command.

Example

The following command initializes Taxonomy Manager:

```
taxonomymanager initialize
```

3.5.4 install

This command installs one or more taxonomies.

Syntax

```
<exec> install [options] Taxonomy+
```

To install multiple taxonomies, add the **Taxonomy** argument multiple times.

The **Taxonomy** argument is one of the following:

- A taxonomy identifier (having a format of **<name>-<version>**, for example: **eba-2.10**). To find out the taxonomy identifiers of the taxonomies you want, run the [list](#)⁴⁰ command. You can also use an abbreviated identifier if it is unique, for example **eba**. If you use an abbreviated identifier, then the latest version of that taxonomy will be installed.
- The path to a **.altova_taxonomies** file downloaded from the Altova website. For information about these files, see [Introduction to TaxonomyManager: How It Works](#)²⁶.

Options

The **install** command takes the following options:

<code>--silent, --s</code>	Display only error messages. The default is false .
<code>--verbose, --v</code>	Display detailed information during execution. The default is false .
<code>--help, --h</code>	Display help for the command.

Example

The following command installs the latest **eba** (European Banking Authority) and **us-gaap** (US Generally Accepted Accounting Principles) taxonomies:

```
taxonomymanager install eba us-gaap
```

3.5.5 list

This command lists taxonomies under the management of Taxonomy Manager. The list displays one of the following

- All available taxonomies
- Taxonomies containing in their name the string submitted as a **Taxonomy** argument
- Only installed taxonomies
- Only taxonomies that can be upgraded

Syntax

```
<exec> list | ls [options] Taxonomy?
```

If no **Taxonomy** argument is submitted, then all available taxonomies are listed. Otherwise, taxonomies are listed as specified by the submitted options (see *example below*). Note that you can submit the **Taxonomy** argument multiple times.

Options

The **list** command takes the following options:

<code>--installed, --i</code>	List only installed taxonomies. The default is false .
<code>--upgradeable, --u</code>	List only taxonomies where upgrades (patches) are available. The default is false .
<code>--help, --h</code>	Display help for the command.

Examples

- To list all available taxonomies, run: `taxonomymanager list`
- To list installed taxonomies only, run: `taxonomymanager list -i`
- To list taxonomies that contain either "eba" or "us-gaap" in their name, run: `taxonomymanager list eba us-gaap`

3.5.6 reset

This command removes all installed taxonomies and the cache directory. You will be completely resetting your taxonomy environment. After running this command, be sure to run the [initialize](#)³⁹ command to recreate the cache directory. Alternatively, run the `reset` command with the `-i` option. Since `reset -i` restores the original installation of the product, we recommend that you run the [update](#)⁴³ command after performing a reset and initialization. Alternatively, run the `reset` command with both the `-i` and `-u` options.

Syntax

```
<exec> reset [options]
```

Options

The **reset** command takes the following options:

<code>--init, --i</code>	Initialize Taxonomy Manager after reset. The default is false .
<code>--update, --u</code>	Updates the list of available taxonomies in the cache. The default is false .
<code>--silent, --s</code>	Display only error messages. The default is false .
<code>--verbose, --v</code>	Display detailed information during execution. The default is false .
<code>--help, --h</code>	Display help for the command.

Examples

- To reset Taxonomy Manager, run: `taxonomymanager reset`
- To reset Taxonomy Manager and initialize it, run: `taxonomymanager reset -i`
- To reset Taxonomy Manager, initialize it, and update its taxonomy list, run: `taxonomymanager reset -i -u`

3.5.7 uninstall

This command uninstalls one or more taxonomies. By default, any taxonomies referenced by the current one are uninstalled as well. To uninstall just the current taxonomy and keep the referenced taxonomies, set the option `--k`.

Syntax

```
<exec> uninstall [options] Taxonomy+
```

To uninstall multiple taxonomies, add the `Taxonomy` argument multiple times.

The `Taxonomy` argument is one of the following:

- A taxonomy identifier (having a format of `<name>-<version>`, for example: `eba-2.10`). To find out the taxonomy identifiers of the taxonomies that are installed, run the `list -i` ⁴⁰ command. You can also use an abbreviated taxonomy name if it is unique, for example `eba`. If you use an abbreviated name, then all taxonomies that contain the abbreviation in its name will be uninstalled.
- The path to a `.altova_taxonomies` file downloaded from the Altova website. For information about these files, see [Introduction to TaxonomyManager: How It Works](#) ²⁶.

Options

The `uninstall` command takes the following options:

<code>--keep-references, --k</code>	Set this option to keep referenced taxonomies. The default is <code>false</code> .
<code>--silent, --s</code>	Display only error messages. The default is <code>false</code> .
<code>--verbose, --v</code>	Display detailed information during execution. The default is <code>false</code> .
<code>--help, --h</code>	Display help for the command.

Example

The following command uninstalls the `eba-2.10` and `us-gaap-2020.0` taxonomies and their dependencies:

```
taxonomymanager uninstall eba-2.10 us-gaap-2020.0
```

The following command uninstalls the `eba-2.10` taxonomy but not the taxonomies it references:

```
taxonomymanager uninstall --k eba-2.10
```

3.5.8 update

This command queries the list of taxonomies available from the online storage and updates the local cache directory. You should not need to run this command unless you have performed a [reset](#)⁴¹ and [initialize](#)³⁹.

Syntax

```
<exec> update [options]
```

Options

The **update** command takes the following options:

<code>--silent, --s</code>	Display only error messages. The default is false .
<code>--verbose, --v</code>	Display detailed information during execution. The default is false .
<code>--help, --h</code>	Display help for the command.

Example

The following command updates the local cache with the list of latest taxonomies:

```
taxonomymanager update
```

3.5.9 upgrade

This command upgrades all installed taxonomies that can be upgraded to the latest available *patched* version. You can identify upgradeable taxonomies by running the [list -u](#)⁴⁰ command.

Note: The **upgrade** command removes a deprecated taxonomy if no newer version is available.

Syntax

```
<exec> upgrade [options]
```

Options

The **upgrade** command takes the following options:

<code>--silent, --s</code>	Display only error messages. The default is false .
<code>--verbose, --v</code>	Display detailed information during execution. The default is false .
<code>--help, --h</code>	Display help for the command.

4 Menu Commands

This section describes the add-in commands available in the **EBA** tab of the Excel ribbon (see *screenshot below*). The commands in the **EBA** tab are organized into four groups: **Report**, **Windows**, **Table Operations** and **Add-in**. The description of each add-in command is provided in the subsections below.

Report

Insert New Report

Creates a new EBA filing report. For more information, see [Create a New Report](#)¹⁰. This command is disabled if the report sheet has already been inserted into the workbook.

Import from XBRL

Imports an XBRL instance file into the current Excel spreadsheet. For details, see [Import Data from XBRL](#)²⁵. This command is disabled if the report has already been inserted into the workbook. To enable the command, save and close the current report (workbook) and create a new workbook.

Export to XBRL

Exports data from all currently active sheets to an XBRL instance file. For more details, see [Export Data to XBRL](#)²⁴.

Validate

Validates report data against the underlying XBRL taxonomy and displays the validation results in the **Validation Report** dialog box. For details, see [Validate Data](#)²².

Windows

Toggle EBA Filing Pane

Toggles the **EBA Filing Pane** on or off. By default, this pane is visible.

Toggle Validation Report

Shows or hides the **Validation Report** window. See [Validate Data](#)²².

Table Operations

Add Sheet (z-Axis)

Adds a new sheet which allows entering data in a third dimension. This button is enabled only if the table supports a third dimension according to the XBRL taxonomy. For more information, see [Enter Data into 3D Tables](#)¹⁸.

Delete Sheet (z-Axis)

Removes the previously added z-axis sheet.

Add Row

Adds a new row to the currently selected table. This button is enabled only if the table supports growing vertically.

Delete Row

Deletes an existing row. This button is enabled only if the table supports growing vertically.

Add Column

Adds a new column to the currently selected table. This button is enabled only if the table supports growing horizontally.

Delete Column

Removes an existing column. This button is enabled only if the table supports growing horizontally.

Add-In

Manage Taxonomies

This command opens the XBRL Taxonomy Manager tool, which allows viewing, installing, and uninstalling XBRL taxonomies. See [Manage XBRL Taxonomies](#)²⁶.

Settings

Displays a dialog box where you can view or change the add-in [settings](#)⁴⁶.

Help

Opens this help file in CHM (Microsoft Compiled HTML Help) format.

Add-In Activation

Displays the activation status of the add-in or provides options to enter or purchase a license key code.

About EBA Add-In

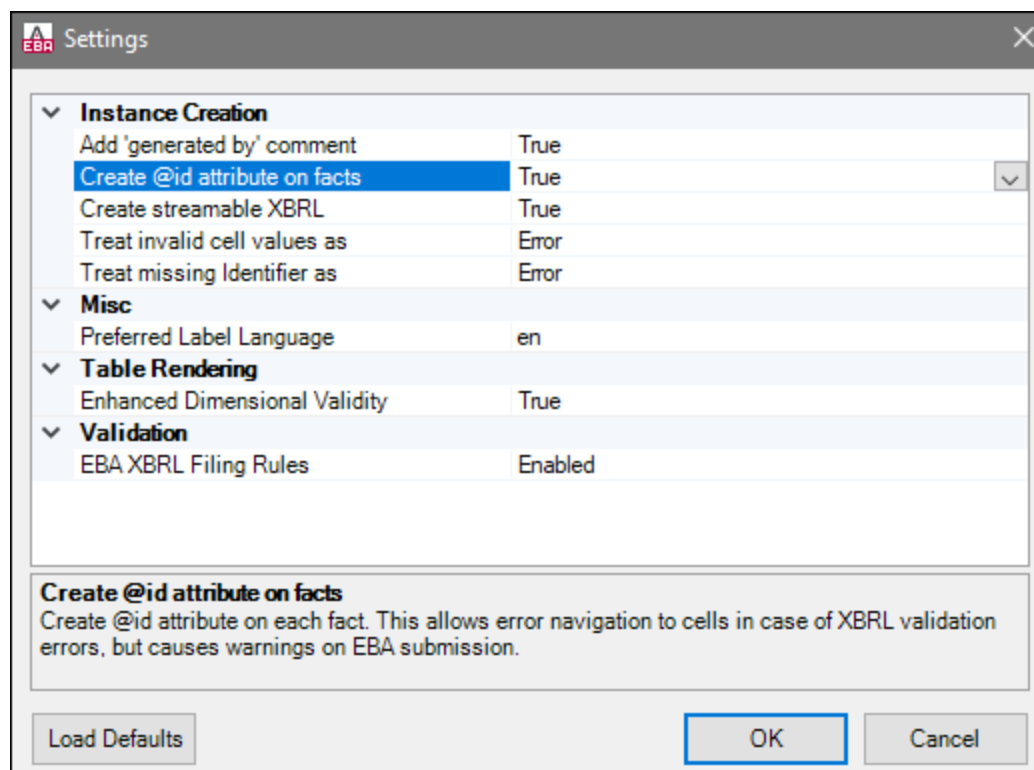

Displays version information about the add-in.

Altova on the Web

Provides links to the Altova website, including Online Support Center, XBRL Taxonomy Download Center, training and tutorials.

5 Settings

The Setting dialog allows you to configure instance creation, table rendering and language parameters and define validation settings. To view or change the add-in settings, click **Settings** in the add-in tab of the Excel ribbon (see screenshot below).

The settings you can configure are listed below.

Instance Creation

The settings below describe the *Instance Creation* section of the **Settings** dialog box.

☐ Add 'generated by' comment

Specifies if the exported XBRL instances should contain a *Generated by* comment. Set this option to `False` if your reporting authority does not allow comments in the created reports. The default value is `True`.

☐ Create @id attribute on facts

According to the [EBA XBRL Filing Rules \(Section 3.7\)](#), unused @id attributes on facts should not be included in the report unless the reporter needs them. In the EBA Add-in, @id attributes are added to all facts, because this allows navigating to cells with validation errors or warnings. By default, the option *Create @id attribute on facts* is set to `True`. If you select `False`, unused @id attributes on facts will not be included in the XBRL report.

Create streamable XBRL

Specifies if the exported XBRL instances should be streamable and contain the `xbml-streamable-instance` processing instruction. Set this option to `False` if your reporting authority does not allow processing instructions in reports. The default value is `True`.

Treat invalid cell values as

Specifies whether invalid cell values should be treated as validation errors or warnings. The default value is `Error`.

Treat missing Identifier as

The *Identifier* property is available in the Filing Pane. By default, this parameter is empty. The *Treat missing Identifier as* option specifies whether an empty *Identifier* property should trigger a validation error or a warning. The default value is `Error`.

Misc

The setting below describes the *Misc* section of the **Settings** dialog box.

Preferred Label Language

Specifies the preferred language to be used in the headers of created worksheets. Note that the respective label resources must be defined in the taxonomy for this setting to take effect. The default value is `en`.

Table Rendering

The setting below describes the *Table Rendering* section of the **Settings** dialog box.

Enhanced Dimensional Validity

The default and recommended setting for the *Enhanced Dimensional Validity* option is `True`. If you encounter problems with data submission to your reporting authority, set this option to `False`.

Validation

The setting below describes the *Validation* section of the **Settings** dialog box.

EBA XBRL Filing Rules

Specifies if the additional EBA XBRL filing rules (defined by the [EBA XBRL Filing Rules](#)) should be checked. The default value is `Enabled`.

6 License Information

This section contains information about:

- the distribution of this software product
- software activation and license metering
- the license agreement governing the use of this product

Please read this information carefully. It is binding upon you since you agreed to these terms when you installed this software product.

To view the terms of any Altova license, go to the [Altova Legal Information page](#) at the [Altova website](#).

6.1 Electronic Software Distribution

This product is available through electronic software distribution, a distribution method that provides the following unique benefits:

- You can evaluate the software free-of-charge for 30 days before making a purchasing decision. (*Note: Altova MobileTogether Designer is licensed free of charge.*)
- Once you decide to buy the software, you can place your order online at the [Altova website](#) and get a fully licensed product within minutes.
- When you place an online order, you always get the latest version of our software.
- The product package includes an onscreen help system that can be accessed from within the application interface. The latest version of the user manual is available at www.altova.com in (i) HTML format for online browsing, and (ii) PDF format for download (and to print if you prefer to have the documentation on paper).

30-day evaluation period

After downloading this product, you can evaluate it for a period of up to 30 days free of charge. About 20 days into the evaluation period, the software will start to remind you that it has not yet been licensed. The reminder message will be displayed once each time you start the application. If you would like to continue using the program after the 30-day evaluation period, you must purchase a product license, which is delivered in the form of a license file containing a key code. Unlock the product by uploading the license file in the Software Activation dialog of your product.

You can purchase product licenses at <https://shop.altova.com/>.

Helping Others within Your Organization to Evaluate the Software

If you wish to distribute the evaluation version within your company network, or if you plan to use it on a PC that is not connected to the Internet, you may distribute only the installer file, provided that this file is not modified in any way. Any person who accesses the software installer that you have provided must request their own 30-day evaluation license key code and after expiration of their evaluation period, must also purchase a license in order to be able to continue using the product.

6.2 Software Activation and License Metering

As part of Altova's Software Activation, the software may use your internal network and Internet connection for the purpose of transmitting license-related data at the time of installation, registration, use, or update to an Altova-operated license server and validating the authenticity of the license-related data in order to protect Altova against unlicensed or illegal use of the software and to improve customer service. Activation is based on the exchange of license related data such as operating system, IP address, date/time, software version, and computer name, along with other information between your computer and an Altova license server.

Your Altova product has a built-in license metering module that further helps you avoid any unintentional violation of the End User License Agreement. Your product is licensed either as a single-user or multi-user installation, and the license-metering module makes sure that no more than the licensed number of users use the application concurrently.

This license-metering technology uses your local area network (LAN) to communicate between instances of the application running on different computers.

Single license

When the application starts up, as part of the license metering process, the software sends a short broadcast datagram to find any other instance of the product running on another computer in the same network segment. If it doesn't get any response, it will open a port for listening to other instances of the application.

Multi-user license

If more than one instance of the application is used within the same LAN, these instances will briefly communicate with each other on startup. These instances exchange key-codes in order to help you to better determine that the number of concurrent licenses purchased is not accidentally violated. This is the same kind of license metering technology that is common in the Unix world and with a number of database development tools. It allows Altova customers to purchase reasonably-priced concurrent-use multi-user licenses.

We have also designed the applications so that they send few and small network packets so as to not put a burden on your network. The TCP/IP ports (2799) used by your Altova product are officially registered with the IANA (see the [IANA Service Name Registry](#) for details) and our license-metering module is tested and proven technology.

If you are using a firewall, you may notice communications on port 2799 between the computers that are running Altova products. You are, of course, free to block such traffic between different groups in your organization, as long as you can ensure by other means, that your license agreement is not violated.

Note about certificates

Your Altova application contacts the Altova licensing server (link.altova.com) via HTTPS. For this communication, Altova uses a registered SSL certificate. If this certificate is replaced (for example, by your IT department or an external agency), then your Altova application will warn you about the connection being insecure. You could use the replacement certificate to start your Altova application, but you would be doing this at your own risk. If you see a *Non-secure connection* warning message, check the origin of the certificate and consult your IT team (who would be able to decide whether the interception and replacement of the Altova certificate should continue or not).

If your organization needs to use its own certificate (for example, to monitor communication to and from client machines), then we recommend that you install Altova's free license management software, [Altova LicenseServer](#), on your network. Under this setup, client machines can continue to use your organization's certificates, while Altova LicenseServer can be allowed to use the Altova certificate for communication with Altova.

6.3 Altova End-User License Agreement

- The Altova End-User License Agreement is available here: <https://www.altova.com/legal/eula>
- Altova's Privacy Policy is available here: <https://www.altova.com/privacy>
