**Altova MapForce Server 2020**
1 Introduction

MapForce Server is an enterprise software solution that runs data mapping transformations on Windows, Linux, and macOS operating systems. The data mappings themselves (or Mapping Design Files, *.mfd) are visually designed with Altova MapForce (https://www.altova.com/mapforce), where you define the inputs, outputs, and any intermediary processing steps that must be applied to your data. The role of MapForce Server is to run MapForce Server Execution (.mfx) files compiled with MapForce, and to produce the output files or data, or even update databases or call Web services, according to the design of the underlying mapping.

MapForce Server can run standalone as well as under the management of Altova FlowForce Server (https://www.altova.com/flowforceserver). When installed on the same machine as MapForce Server, FlowForce Server automates execution of mappings through scheduled or trigger-based jobs, which can also be exposed as Web services. In addition to this, FlowForce Server includes a built-in library of functions that enable you to take additional automated actions before or after mapping execution, such as sending email, copying files and directories, uploading files to FTP, running shell commands, and others.

Features

- Server-level performance when executing data mappings
- Cross-platform: MapForce Server runs on Windows, Linux, or macOS operating systems
- Command line interface
- An API that you can call from C++, C#, Java, VB.NET, VBScript, or VBA code
- Native integration with FlowForce Server
- Support for Altova Global Resources—a way of making file, folder, or database references configurable and portable across multiple environments and across multiple Altova applications, see Altova Global Resources
- Runs mappings that read data from and write data to Protocol Buffers binary format
- Runs mappings that perform bulk database inserts

Limitations

- XML digital signatures are not supported
- ADO, ADO.NET, and ODBC database connections are supported only on Windows. On Linux and macOS, native database connectivity is available for SQLite and PostgreSQL databases. For other databases running on Linux or macOS, JDBC should be used.

Last updated: 10 March 2020
2 Installation

2.1 System Requirements

- **Windows**
  - Windows 7 SP1 with Platform Update, Windows 8, Windows 10

- **Windows Server**
  - Windows Server 2008 R2 SP1 with Platform Update or newer

On Windows, MapForce Server is available both as a 32-bit and 64-bit package.

- **Linux**
  - CentOS 6 or newer
  - RedHat 6 or newer
  - Debian 8 or newer
  - Ubuntu 16.04 LTS or newer

The following libraries are required as a prerequisite to install and run the application. If the packages below are not already available on your Linux machine, run the command `yum` (or `apt-get` if applicable) to install them.

<table>
<thead>
<tr>
<th>Required by</th>
<th>CentOS, RedHat</th>
<th>Debian</th>
<th>Ubuntu</th>
</tr>
</thead>
<tbody>

<td>libidn, krb5-libs</td>
<td>libidn11, libgssapi-krb5-2</td>
<td>libidn11, libgssapi-krb5-2</td>
</tr>
</tbody>
</table>

- **macOS**
  - macOS 10.13 or newer

**Note:** On Windows and macOS, it is possible to install multiple versions of MapForce Server on the same machine. In such cases, be aware that only one version can be registered to the same Altova LicenseServer at a time. Hence, two different versions of MapForce Server cannot run concurrently on the same machine. Multiple instances of the same product version can run in parallel, however. For more information, see the Altova License Server documentation (https://www.altova.com/documentation#licenseserver).
2.2 Processor Cores and Licenses

The licensing of Altova server products is based on the number of physical processor cores available on the product machine (as opposed to the number of logical cores). For example, a dual-core processor has two cores, a quad-core processor four cores, a hexa-core processor six cores, and so on. The number of cores licensed for a product must be greater than or equal to the number of cores available on that server machine, whether the server is a physical or virtual machine. For example, if a server has eight cores, you must purchase an 8-core license. You can also combine licenses to achieve the core count. So, two 4-core licenses can be used for an eight-core server instead of one 8-core license.

If you are using a computer server with a large number of CPU cores but only have a low volume to process, you may also create a virtual machine that is allocated a smaller number of cores, and purchase a license for that number. Such a deployment, of course, will have less processing speed than if all available cores of the computer were utilized.

**Note:** Each Altova server product license can be used for only one client machine at a time—the machine on which the Altova server product is installed—even if the license has unused licensing capacity. For example, if a 10-core license is used for a client machine that has 6 CPU cores, then the remaining 4 cores of licensing capacity cannot be used simultaneously for another client machine.

**Single-thread execution**

If an Altova server products allow single-thread execution, an option for *Single-thread execution* will be available. In these cases, if an Altova server-product license for only one core is available in the license pool, a machine with multiple cores can be assigned this one-core license. In such a case, the machine will run that product on a single core. Processing will therefore be slower, because multi-threading (which is possible on multiple cores) will not be available. The product will be executed in single thread mode on that machine.

To assign a single-core license to a multiple-core machine, in LicenseServer, select the *Limit to single thread execution* check box for that product.

**Estimate of core requirements**

There are various external factors that influence the data volumes and processing times your server can handle (for example: the hardware, the current load on the CPU, and memory allocation of other applications running on the server). In order to measure performance as accurately as possible, test the applications in your environment with data volumes and in conditions that approximate as closely as possible to real business situations.
2.3 Important Paths

Installation directory
The application is installed in the following directory:

- **Linux**
  
  /opt/Altova/MapForceServer2020/bin

- **Mac**
  
  /usr/local/Altova/MapForceServer2020/bin

- **Windows**
  
  `<ProgramFilesFolder>\Altova\MapForceServer2020\bin`

Executable
After installation, the MapForce Server executable can be found at the following path:

- **Linux**
  
  /opt/Altova/MapForceServer2020/bin/mapforceserver

- **Mac**
  
  /usr/local/Altova/MapForceServer2020/bin/mapforceserver

- **Windows**
  
  `<ProgramFilesFolder>\Altova\MapForceServer2020\bin\MapForceServer.exe`

Application Configuration Data
The application's configuration data is stored in the following directory:

- **Linux**
  
  /var/opt/Altova/MapForceServer

- **Mac**
  
  /var/Altova/MapForceServer

- **Windows**
  
  C:\ProgramData\Altova\MapForceServer
2.4 Linux

2.4.1 Installing MapForce Server

System requirements

- **Linux**
  - CentOS 6 or newer
  - RedHat 6 or newer
  - Debian 8 or newer
  - Ubuntu 16.04 LTS or newer

The following libraries are required as a prerequisite to install and run the application. If the packages below are not already available on your Linux machine, run the command `yum` (or `apt-get` if applicable) to install them.

<table>
<thead>
<tr>
<th>Required by</th>
<th>CentOS, RedHat</th>
<th>Debian</th>
<th>Ubuntu</th>
</tr>
</thead>
<tbody>
<tr>
<td>LicenseServer</td>
<td>krb5-libs</td>
<td>libgssapi-krb5-2</td>
<td>libgssapi-krb5-2</td>
</tr>
<tr>
<td>MapForce Server</td>
<td>libidn, krb5-libs</td>
<td>libidn11, libgssapi-krb5-2</td>
<td>libidn11, libgssapi-krb5-2</td>
</tr>
</tbody>
</table>

Prerequisites

- Perform installation either as root user or as a user with sudo privileges.
- The previous version of MapForce Server must be uninstalled before a new one is installed.
- If you are installing FlowForce Server with other Altova server products, it is recommended to install FlowForce Server first.

Installing MapForce Server

1. Download the installation package from https://www.altova.com/download#server to a local directory.
2. Change to the directory where you downloaded the installation package, for example:
   ```bash
cd /home/User/Downloads
   ```
3. Install the MapForce Server package.
   ```bash
   [Debian, Ubuntu] sudo dpkg --install mapforceserver-2020-debian.deb
   [CentOS, RedHat] sudo rpm -ivh mapforceserver-2020-1.x86_64.rpm
   ```

**Note:** You may need to adjust the name of the package above to match the current release or service pack version.
Licensing MapForce Server

1. Ensure that the latest version of Altova LicenseServer (https://www.altova.com/licenseserver) is installed and running either on the local machine or network.

2. Register MapForce Server with Altova LicenseServer. For this, you need to know either the host name or the IP address of the computer where LicenseServer runs. For example, if LicenseServer runs on 127.0.0.1, you can register it as follows:

   ```
   sudo ./mapforceserver licenseserver 127.0.0.1
   ```

**Note:** The command above assumes you are calling the executable from the program installation directory, see also Important Paths.

3. Log on to LicenseServer administration interface and assign the license to the machine where MapForce Server runs.

For more information about licensing, refer to Altova LicenseServer documentation (https://www.altova.com/documentation).

### 2.4.2 Viewing Currently Installed Products

To check if an Altova server product is installed:

- Run the following command:

  ```
  [Debian, Ubuntu] dpkg --list | grep Altova
  [CentOS, RedHat] rpm -qa | grep server
  ```

### 2.4.3 Uninstalling MapForce Server

To uninstall MapForce Server:

- Run the following command:

  ```
  [Debian, Ubuntu] sudo dpkg --remove mapforceserver
  [CentOS, RedHat] sudo rpm -e mapforceserver
  ```

If you need to uninstall other packages, use the same command as above and supply the package you want to remove as argument. For example:

```
[Debian, Ubuntu] sudo dpkg --remove licenseserver
[CentOS, RedHat] sudo rpm -e licenseserver
```
2.5  macOS

2.5.1  Installing MapForce Server

System requirements

- macOS
  - macOS 10.13 or newer

Prerequisites
- Perform installation as a user with administrative (root) privileges.

FlowForce Server Integration

If you install MapForce Server together with FlowForce Server, it is recommended that you install FlowForce Server first. Otherwise, see the "Post-installation tasks" below.

Installing MapForce Server
1. Download the disk image (.dmg) file from the Altova Download Center (https://www.altova.com/download) and click to open it. Once you do this, the installer appears as a new drive on your computer.
2. Double-click the package (.pkg) file, and go through the successive steps of the installation wizard. These are self-explanatory and include one step in which you have to agree to the license agreement before being able to proceed. When you complete the wizard, the MapForce Server icon becomes available in Applications. The package is installed in the directory /usr/local/Altova/MapForceServer2020/.
3. If you have not installed Altova License Server already, or if you want to upgrade to the latest version, double-click the corresponding package (.pkg) file and follow the on-screen instructions.

Licensing MapForce Server
1. Ensure that the latest version of Altova LicenseServer (https://www.altova.com/licenseserver) is installed and running either on the local machine or network.
2. Register MapForce Server with Altova LicenseServer. For this, you need to know either the host name or the IP address of the computer where LicenseServer runs. For example, if LicenseServer runs on 127.0.0.1, you can register it as follows:

```
sudo mapforceserver licenseserver 127.0.0.1
```
3. Log on to LicenseServer administration interface and assign the license to the machine where MapForce Server runs.

For more information, refer to Altova LicenseServer documentation (https://www.altova.com/documentation).

**Post-installation tasks**

If you installed MapForce Server before FlowForce Server, then, after having installed both MapForce Server and FlowForce Server, run the following command:

```bash
cp /usr/local/Altova/MapForceServer2019/etc/*.tool /usr/local/Altova/FlowForceServer2019/tools
```

The command above copies the `.tool` file from `/etc` directory of MapForce Server to the FlowForce Server `/tools` directory. The `.tool` file is required by FlowForce Server; it contains the path to the MapForce Server executable. You do not need to run this command if you install FlowForce Server before installing MapForce Server.

### 2.5.2 Uninstalling MapForce Server

**To uninstall MapForce Server:**

1. In **Applications**, right-click the MapForce Server icon and select **Move to Trash**. Note that your MapForce Server installation directory and configuration data are not removed by this step.
2. Optionally, if you want to remove the MapForce Server installation directory as well, run the following command:

   ```bash
   sudo rm -rf /usr/local/Altova/MapForceServer2020/
   ```

**Note:** The steps above do not remove the configuration data from `/var/Altova/MapForceServer2020`. Be aware that once the configuration data is removed, it cannot be recovered later.
2.6 Windows

2.6.1 Installing MapForce Server

System requirements
- Windows 7 SP1 with Platform Update, Windows 8, Windows 10
- Windows Server 2008 R2 SP1 with Platform Update or newer

Prerequisites
- Perform installation as a user with administrative privileges.

Installing MapForce Server

To install MapForce Server standalone:

1. Download the installation file from the Altova Download Center (https://www.altova.com/download) and run it.
2. Optionally, select the installation language from the box in the lower left area of the wizard, and click Next. You can change the language later from the command line.
3. Do one of the following:
   a. If you haven't installed Altova LicenseServer yet, leave the default settings as is. The wizard will install the latest version of Altova LicenseServer on the computer where you are running the wizard.
   b. If you haven't installed Altova LicenseServer yet and want to install Altova LicenseServer on another computer, clear the Install Altova LicenseServer on this machine check box, and then choose Register Later. In this case, you will need to install Altova LicenseServer and register MapForce Server separately.
   c. If Altova LicenseServer has already been installed on your computer but it has a lower version than the one indicated by the installation wizard, leave the default settings as is. In this case, the installation wizard will automatically upgrade your LicenseServer version with the one indicated on the dialog box. Note that the existing registration and licensing information will be preserved after the upgrade.
   d. If Altova LicenseServer has already been installed on your computer or network, and if it has the same version as the one indicated by the wizard, do the following:
      i. Clear the Install Altova LicenseServer on this machine check box.
      ii. Under Register this product with, choose the Altova LicenseServer instance on which you want to register MapForce Server, or choose Register later. Note that you can always select Register Later if you want to ignore the LicenseServer associations and carry on with the installation of MapForce Server.
4. Click Next.
5. Follow the wizard instructions to complete the installation.
Licensing MapForce Server

1. Ensure that the latest version of Altova LicenseServer (https://www.altova.com/licenseserver) is installed and running either on the local machine or network.
2. If you haven't done so already during installation, register MapForce Server with Altova LicenseServer. For this, you need to know either the host name or the IP address of the computer where LicenseServer runs. For example, if LicenseServer runs on 127.0.0.1, you can register it as follows:

   MapForceServer.exe licenseserver 127.0.0.1

3. Log on to LicenseServer administration interface and assign the license to the machine where MapForce Server runs.

For more information, refer to Altova LicenseServer documentation (https://www.altova.com/documentation).

2.6.2 Uninstalling MapForce Server

Uninstalling MapForce Server

1. Right-click the Windows "Start" button and select Settings.
2. Open the Control Panel (start typing "Control Panel" and click the suggested entry).
3. Under Programs, click Uninstall a program.
4. In Control Panel, select “Altova MapForce Server” and then click Uninstall.
3 Running Mappings

The role of MapForce Server is to execute data mappings created with Altova MapForce (https://www.altova.com/mapforce.html).

First, you design the data mappings (or Mapping Design Files, *.mfd) visually in MapForce, where you define the inputs, outputs, and any intermediary processing steps that must be applied to your data (including sorting, filtering, custom functions, and others). Once your mapping is ready, you can execute it with MapForce Server in one of the following ways:

- On the Windows machine where MapForce runs, compile the mapping to a MapForce Server Execution File (.mfx). The .mfx files are in fact data mappings packaged for execution in a server environment. You can copy such files to any of the supported operating systems where MapForce Server runs (including across different platforms, see System Requirements). On the server machine, you can execute the .mfx file using the command line interface of MapForce Server, or using the MapForce Server API.

- On the Windows machine where MapForce runs, deploy the mapping to a server machine where both MapForce Server and FlowForce Server are installed. The server machine can be a different operating system (see System Requirements). Mappings deployed in this way become FlowForce Server functions and you can create scheduled or trigger-based jobs from them. When mappings run as FlowForce Server jobs, they can also be exposed as Web services, chained as sub-steps of other jobs, or made part of workflows which include sending emails, verifying exit codes, running shell commands, and others.
Running Mappings

How to execute mappings compiled as MapForce Server Execution files
1. Run MapForce Enterprise or Professional Edition.
2. Open the mapping to be compiled.
3. On the File menu, click Compile to MapForce Server Execution file, and select a destination directory.
4. Copy the .mfx file to the destination directory or server, along with any input files or dependencies. For further information, see Preparing Mappings for Server Execution.
5. Call the "run" command of the command line interface, or the equivalent method of the MapForce Server API.

How to execute mappings deployed to FlowForce Server
1. Open in MapForce Enterprise or Professional the mapping to be deployed.
2. Make sure that the transformation language (execution engine) of the mapping is set to Built-in. To change the execution engine to Built-in, select the menu command Output | Built-In Execution Engine, or click the Select Built-In Execution Engine toolbar button.
4. Enter the server connection details (host, port), the FlowForce credentials, and the destination FlowForce container. To proceed to creating the FlowForce job immediately in the browser, select the option Open web browser to create new job. You can also create the FlowForce job later (see next step).
5. Open a browser, log on to the FlowForce Server Web administration interface, and navigate to the container where you deployed the mapping (see previous step). This step is not required if you selected the option Open web browser to create new job in the previous step.
6. Define the FlowForce Server job, including its triggers, parameters, or additional execution steps (for examples, refer to the FlowForce Server documentation).

Whenever the job is configured to run, the underlying mapping transformation will be executed, and the mapping output will be produced.

Note: If MapForce Server runs on a machine other than the one where the mapping was designed, make sure to adjust paths to input files or database connection details in such a way that they are meaningful in the new target execution environment. For example, if a mapping calls a database and requires a database driver, the driver must also be installed in the target environment in order for the mapping to
be executed successfully. To view or adjust the database connection details, right-click the database component in MapForce and select **Properties**. After making any changes to the mapping design in MapForce, remember to recompile it to a MapForce Server execution file (.mfx) or, depending on the case, redeploy it to FlowForce Server. For more information, see [Preparing Mappings for Server Execution](#).
Preparing Mappings for Server Execution

A mapping designed and previewed with MapForce may refer to resources which are outside of the current machine and operating system (such as databases). In addition to this, in MapForce, all mapping paths follow Windows-style conventions by default. Thirdly, the machine where MapForce Server runs might not support the same database connections as the machine where the mapping was designed. For this reason, running mappings in a server environment typically requires some preparation, especially if the target machine is not the same as the source machine.

Note: The term “source machine” refers to the computer where the MapForce is installed and the term “target machine” refers to the computer where MapForce Server or FlowForce Server is installed. In the most simple scenario, this is the same computer. In a more advanced scenario, MapForce runs on a Windows machine whereas MapForce Server or FlowForce Server runs on a Linux or macOS machine.

As best practice, always make sure that the mapping validates successfully in MapForce before deploying it to FlowForce Server or compiling it to a MapForce Server execution file.

If MapForce Server runs standalone (without FlowForce Server), the required licenses are as follows:

- On the source machine, MapForce Enterprise or Professional edition is required to design the mapping and compile it to a server execution file (.mfx).
- On the target machine, MapForce Server or MapForce Server Advanced Edition is required to run the mapping.

If MapForce Server runs under FlowForce Server management, the following requirements apply:

- On the source machine, MapForce Enterprise or Professional edition is required to design the mapping and deploy it to a target machine.
- Both MapForce Server and FlowForce Server must be licensed on the target machine. The role of MapForce Server is to run the mapping; the role of FlowForce is to make the mapping available as a job which benefits from features such as scheduled or on demand execution, execution as a Web service, error handling, conditional processing, email notifications, and others.
- FlowForce Server must be up and running at the configured network address and port. Namely, the “FlowForce Web Server” service must be started and configured to accept connections from HTTP clients (or HTTPS if configured) and must not be blocked by the firewall. The “FlowForce Server” service must also be started and running at the designated address and port.
- You have a FlowForce Server user account with permissions to one of the containers (by default, the /public container is accessible to any authenticated user).

General considerations

- If you intend to run the mapping on a target machine with standalone MapForce Server, all input files referenced by the mapping must be copied to the target machine as well. If MapForce Server runs under FlowForce Server management, there is no need to copy files manually. In this case, the instance and schema files are included in the package deployed to the target machine.
- If the mapping includes database components which require specific database drivers, such drivers must be installed on the target machine as well. For example, if your mapping reads data from a Microsoft Access database, then Microsoft Access or Microsoft Access Runtime (https://www.microsoft.com/en-us/download/details.aspx?id=50040) must be installed on the target machine as well.
When you deploy a mapping to non-Windows platforms, ADO, ADO.NET and ODBC database connections are automatically changed to JDBC. Native SQLite and native PostgreSQL connections are preserved as such and require no additional configuration. See also "Database connections" below.

- If the mapping contains custom function calls (for example, to .dll or .class files), such dependencies are not deployed together with the mapping, since they are not known before runtime. In this case, copy them manually to the target machine. The path of the .dll or .class file on the server must be the same as in the "Manage Libraries" window in MapForce, for example:

![Manage Libraries](image.png)

- Some mappings read multiple input files using a wildcard path. In this case, the input file names are not known before runtime and so they are not deployed. For the mapping to execute successfully, the input files must exist on the target machine.

- If the mapping output path includes directories, those directories must exist on the target machine. Otherwise, an error will be generated when you execute the mapping. This behavior is unlike MapForce, where non-existing directories are generated automatically if the option **Generate output to temporary files** is enabled.

- If the mapping calls a Web service that requires HTTPS authentication with a client certificate, the certificate must be transferred to the target machine as well, see Digital Certificate Management.

- If the mapping connects to file-based databases such as Microsoft Access and SQLite, the database file must be manually transferred to the target machine or saved to a shared directory which is accessible to both the source and the target machine and referenced from there, see "File-based databases" below.

Making paths portable

If you intend to run the mapping on a server, ensure that the mapping follows the applicable path conventions and uses a supported database connection.

To make paths portable to non-Windows operating systems, use relative instead of absolute paths when designing the mapping in MapForce:

1. Open the desired mapping design file (.mfd) with MapForce on Windows.
2. On the **File** menu, select **Mapping Settings**, and clear the **Make paths absolute in generated code** check box if it is selected.
3. For each mapping component, open the **Properties** dialog box (by double-clicking the component's title bar, for example), and change all file paths from absolute to relative. Also, select the **Save all file paths relative to MFD file** check box. For convenience, you can copy all input files and schemas in the same folder as the mapping itself, and reference them just by the file name.
For more information about dealing with relative and absolute paths while designing mappings, refer to MapForce documentation.

Importantly, both MapForce Server and FlowForce Server support a so-called "working directory" against which all relative paths will be resolved. The working directory is specified at mapping runtime, as follows:

- In FlowForce Server, by editing the "Working-directory" parameter of any job.
- In MapForce Server API, through the `WorkingDirectory` property of the COM and .NET API, or through the `setWorkingDirectory` method of the Java API.
- In MapForce Server command line, the working directory is the current directory of the command shell.

**Database connections**

Be aware that ADO, ADO.NET, and ODBC connections are not supported on Linux and macOS machines. Therefore, if the target machine is Linux or macOS, such connections are converted to JDBC when you deploy the mapping to FlowForce or when you compile the mapping to a MapForce Server execution file. In this case, you have the following options before deploying the mapping or compiling it to a server execution file:

- In MapForce, create a JDBC connection to the database
- In MapForce, fill the JDBC database connection details in the "JDBC-specific Settings" section of the database component.

If the mapping uses a native connection to a PostgreSQL or SQLite database, the native connection is preserved and no JDBC conversion takes place. If the mapping connects to a file-based database, such as Microsoft Access and SQLite, additional configuration is required, see "File-based databases" below.

Running mappings with JDBC connections requires that the Java Runtime Environment or Java Development Kit be installed on the server machine. This may be either Oracle JDK or an open source build such as Oracle OpenJDK.

- The `JAVA_HOME` environment variable must point to the JDK installation directory.
- On Windows, a Java Virtual Machine path found in the Windows registry will take priority over the `JAVA_HOME` variable.
- The JDK platform (64-bit, 32-bit) must be the same as that of MapForce Server. Otherwise, you may get an error with the reason: "JVM is inaccessible".

### To set up a JDBC connection on Linux or macOS:

1. Download the JDBC driver supplied by the database vendor and install it on the operating system. Make sure to select the 32-bit version if your operating system runs on 32-bit, and the 64-bit version if your operating system runs on 64-bit.
2. Set the environment variables to the location where the JDBC driver is installed. Typically, you will need to set the `CLASSPATH` variable, and possibly a few others. To find out which specific environment variables must be configured, check the documentation supplied with the JDBC driver.

**Note:** On macOS, the system expects any installed JDBC libraries to be in the `/Library/Java/Extensions` directory. Therefore, it is recommended that you unpack the JDBC driver to this location; otherwise, you will need to configure the system to look for the JDBC library at the path where you installed the JDBC driver.
Oracle Instant Client connections on macOS

These instructions are applicable if you connect to an Oracle database through the Oracle Database Instant Client, on macOS. Prerequisites:

- Java 8.0 or later must be installed. If the Mac machine runs a Java version prior to Java 8, you can also connect through the JDBC Thin for All Platforms library, and disregard the instructions below.
- Oracle Instant Client must be installed. You can download the Oracle Instant Client from the Oracle official download page. Note that there are several Instant Client packages available on the Oracle download page. Make sure to select a package with Oracle Call Interface (OCI) support, (for example, Instant Client Basic). Also, make sure to select the 32-bit version if your operating system runs on 32-bit, and the 64-bit version if your operating system runs on 64-bit.

Once you have downloaded and unpacked the Oracle Instant Client, edit the property list (.plist) file shipped with the installer so that the following environment variables point to the location of the corresponding driver paths, for example:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Sample Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLASSPATH</td>
<td>/opt/oracle/instantclient_11_2/ojdbc6.jar:/opt/oracle/instantclient_11_2/ojdbc5.jar</td>
</tr>
<tr>
<td>TNS_ADMIN</td>
<td>/opt/oracle/NETWORK_ADMIN</td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>/opt/oracle/instantclient_11_2</td>
</tr>
<tr>
<td>DYLD_LIBRARY_PATH</td>
<td>/opt/oracle/instantclient_11_2</td>
</tr>
<tr>
<td>PATH</td>
<td>$PATH:/opt/oracle/instantclient_11_2</td>
</tr>
</tbody>
</table>

Note: Edit the sample values above to fit the paths where Oracle Instant Client files are installed on your operating system.

File-based databases

File-based databases such as Microsoft Access and SQLite are not included in the package deployed to FlowForce Server or in the compiled MapForce Server execution file. Therefore, if the source and target machine are not the same, take the following steps:

1. In MapForce, right-click the mapping and clear the check box Make paths absolute in generated code.
2. Right-click the database component on the mapping and add a connection to the database file using a relative path. A simple way to avoid path-related issues is to save the mapping design (.mfd file) in the same directory as the database file and to refer to the latter from the mapping just by file name (thus using a relative path).
3. Copy the database file to a directory on the target machine (let's call it "working directory"). Keep this directory in mind since it will be required to run the mapping on the server, as shown below.

To run such mappings on the server, do one of the following:

- If the mapping will be run by MapForce Server under FlowForce Server control, configure the FlowForce Server job to point to the working directory created previously. The database file must reside in the
Preparing Mappings for Server Execution

Running Mappings

If the mapping will be run by standalone MapForce Server at the command line, change the current directory to the working directory (for example, `cd path\to\working\directory`) before calling the `run` command of MapForce Server.

If the mapping will be run by the MapForce Server API, set the working directory programmatically before running the mapping. To facilitate this, the property `WorkingDirectory` is available for the MapForce Server object in the COM and .NET API. In the Java API, the method `setWorkingDirectory` is available.

If both the source and the target machines are Windows machines running on the local network, an alternative approach is to configure the mapping to read the database file from a common shared directory, as follows:

1. Store the database file in a common shared directory which is accessible by both the source and the target machine.
2. Right-click the database component on the mapping and add a connection to the database file using an absolute path.

Global Resources

If a mapping includes references to Global Resources instead of direct paths or database connections, you will be able to use Global Resources on the server side as well. When you compile a mapping to a MapForce Server execution file (.mfx), the references to Global Resources will be kept intact, so that you can provide these on the server side, at mapping runtime. When deploying a mapping to FlowForce Server, you can optionally choose whether it should use resources on the server.

For mappings (or mapping functions, in case of FlowForce Server) to run successfully, the actual file, folder, or database connection details that you supply as Global Resources must be compatible with the server environment. For example, files and folders paths must use the Linux convention for paths if the mapping will run on a Linux server. Likewise, Global Resources defined as database connections must be possible on the server machine.

For further information, see Global Resources.

XBRL Taxonomy Packages

When you deploy a mapping that references XBRL Taxonomy Packages to FlowForce Server, MapForce collects all external references from the mapping and then resolves them using the current configuration and currently installed taxonomy packages. If there are resolved external references that point to a taxonomy package, then the taxonomy package is deployed together with the mapping. FlowForce Server will use that package—as it was during deployment—to execute the mapping. To refresh the taxonomy package used by FlowForce Server, you will need to change it in MapForce and redeploy the mapping.

Note that the root catalog of MapForce Server influences the way taxonomies are resolved on the target machine. The root catalog is found at the following path relative to the MapForce Server installation directory: `etc/RootCatalog.xml`.

Taxonomy packages that were deployed with a mapping will be used if the root catalog of MapForce Server does not already contain such package or does not contain a package that is defined for the same URL prefix. The root catalog of MapForce Server has priority over the deployed taxonomy.

If MapForce Server runs standalone (without FlowForce Server), it is possible to specify the root catalog that
should be used by the mapping as follows:

- At the command line, this is possible by adding the option `-catalog` to the `run` command.
- In the MapForce Server API, call the method `SetOption`, and supply the string "catalog" as first argument, and the path to the root catalog as second argument.

If a mapping uses XBRL components with table linkbases, the taxonomy package or the taxonomy package configuration file must be supplied to the mapping at runtime, as follows:

- At the MapForce Server command line, add the option `--taxonomy-package` or `--taxonomy-packages-config-file` to the `run` command.
- In the MapForce Server API, call the method `SetOption`. The first argument must be either "taxonomy-package" or "taxonomy-packages-config-file". The second argument must be the actual path to the taxonomy package (or taxonomy package configuration) file.
3.2 Global Resources

Altova Global Resources are portable references to files, folders, or databases. When stored as Global Resources, paths and database connection details become reusable and available across multiple Altova applications. For example, if you frequently need to open the same file in multiple Altova desktop applications, you may find it convenient to define it as a Global Resource. This way, you don't even need to remember the file path because you can select the respective Global Resource from the "Open File" dialog box instead. This also has the advantage that, if the file path ever changes, you will change it in one place only.

A typical usage of Global Resources is to define a database connection once and reuse it across all Altova applications that support Global Resources. For example, you can create a database connection on the machine where a MapForce mapping was designed and then reuse the same connection on the machine where MapForce Server runs the mapping (this may require, in some cases, that both machines have the same database client software installed).

Optionally, you can create multiple variations of the same Global Resource (known as "configurations"). This lets you easily switch file or folder paths (or even databases) depending on your needs. For example, you could create a "database" resource with two configurations: "development" and "production". Taking MapForce Server as example, you could then easily retrieve data from either the development or production database, by indicating the desired configuration as command line parameter at mapping runtime.

You can create Global Resources from the following Altova desktop applications: Altova Authentic, DatabaseSpy, MobileTogether Designer, MapForce, StyleVision, and XMLSpy. On the server side, Global Resources can be consumed by the following Altova server applications: FlowForce Server, MapForce Server, RaptorXML Server, RaptorXML+XBRL Server.

For more information about creating Global Resources, refer to the "Altova Global Resources" chapter of MapForce documentation.

Resources in MapForce Server

When you compile a mapping to a MapForce Server execution file (.mfx), any Global Resource references used by the mapping are preserved, not resolved. This means that you will need to provide these references on the server side in order to run the mapping successfully. More specifically, in MapForce Server, the following is required to run an .mfx file which uses Global Resources:

1. The Global Resource XML file. On the machine where MapForce is installed, the file is called GlobalResources.xml, and you can find it in the Documents\Altova folder. You can copy this file to the machine where MapForce Server runs, and you can also create multiple such files if necessary.
2. The Global Resource configuration name. Each Global Resource has a default configuration called "Default", but you can create additional configurations if so required. If you created additional configurations, then you must specify the desired configuration name instead of "Default".

In MapForce, the Global Resource file path and the Global Resource configuration name are set or changed from the graphical user interface. In MapForce Server, these are specified at mapping runtime.

- If you run the mapping through the command line interface, set the options --globalresourceconfig and --globalresourcefile after the run command, for example:

```bash
C:\Program Files (x86)\Altova\MapForceServer2020\bin\MapForceServer.exe run
```
If you run the mapping through the MapForce Server API, call the method `SetOptions` two times before calling the `Run` method. The first call is required to supply the Global Resource XML file path as option, and the second one is required to supply the Global Resource configuration name. For further information, see the MapForce Server API.
3.3 Credentials

Credential objects provide a way to make authentication data (such as usernames and passwords) portable across various mapping execution environments, in a secure way. Credentials are useful in mappings that require basic HTTP authentication. You can define credentials in MapForce and also in FlowForce Server. If credentials were defined in MapForce, you can optionally deploy them to FlowForce Server, similar to how mappings are deployed.

After you compile the mapping to a MapForce Server execution file (.mfx), MapForce Server will run the .mfx file depending on your choices at mapping design time.

If you selected the Include in MapForce Server Execution File and Mapping Deployment check box when creating the credential in MapForce, MapForce Server will use at mapping runtime any credentials that were stored in the .mfx file. This means that you can run the mapping with a command such as:

```xml
<exec> run mapping.mfx
```

Where `<exec>` is the path to the MapForce Server executable. This path can be either absolute or, if the current directory is the same as the executable, you can enter just the executable name.

If you entered only the credential name (without username and password) in MapForce, then you must explicitly provide these details at mapping runtime, with the help of the `--credential` command line option available for the `run` command. This way, you can use, for example, a different set of credentials in production, as opposed to those used when you designed the mapping. The `--credential` option has the form `--credential=KEY:VALUE`, where

- **KEY** is the name of the credential as it was defined in MapForce.
- **VALUE** is a credential property, or a list of properties separated by ampersand (&). For credentials of type "password", the possible properties are `username` and `password`. For credentials of type OAuth 2.0, the only supported property is `oauth:token`.
- The actual property values are supplied just like query parameters in a URL, using the "=" sign.

For example:

```xml
<exec> run mapping.mfx --credential="mycredential:username=admin&password=4xJ38dnx7"
```

In the code listing above, the value of the `--credential` option was enclosed within quotes in order to treat the value literally, since the username and password are separated by an ampersand character.

If your mapping needs multiple sets of named credentials to run, you can specify the `--credential` option multiple times.

The credentials supplied as command line options take precedence over stored credentials.

If you did not select the Include in MapForce Server Execution File and Mapping Deployment check box, the sensitive fields are missing. This means that you must supply the password at the command line while still referring the credential by its name, for example:
MapForce Server API

The MapForce Server API provides methods to create credentials, add properties to credentials, and close credentials after you finished declaring them. The following code listing illustrates the typical way of declaring password credentials in a C# program that runs a mapping:

```csharp
//Create a MapForce Server object
// Set the credential name as it was defined in MapForce
objMFS.BeginCredential("mycredential");
// Add the credential properties
objMFS.AddCredentialProperty("username", "altova");
objMFS.AddCredentialProperty("password", "b45ax78!");
// Close the credential
objMFS.EndCredential();
```

If the mapping needs multiple credential sets, use the methods above to add as many sets of credentials as required. Once you have declared all the required credentials, you can run the mapping execution file in a standard way, by calling the Run() method. For more information, see the API Reference.

<exec> run mapping.mfx --credential=mycredential:password=4xJ38dnx7</exec>
3.4 Dynamic Authentication

In MapForce, it is possible to configure mappings that call Web services for basic HTTP authentication. Dynamic authentication is one of the ways to achieve this; it is an alternative to using credentials. Dynamic authentication means designing the mapping so that it accepts the username and password as input parameters. For details about configuring dynamic authentication, refer to MapForce documentation (https://www.altova.com/documentation).

If you configured the mapping for dynamic authentication, then the respective username and password must be supplied as parameters at mapping runtime. This is not different from supplying any other parameter kinds to the mapping. For example, when calling MapForce Server at the command line, the syntax for a mapping like the one above is:

```
<exec> run mapping.mfx --p=username:admin --p=password:dj9JaVax
```

Where:

- `<exec>` is the path to the MapForce Server executable. This path can be either absolute or, if the current directory is the same as the executable, you can enter just the executable name.
- `username` and `password` are the names of the respective input parameters on the MapForce mapping.

When calling the MapForce Server API, you can authenticate the mapping by calling the `AddParameter` method before calling the `Run` method. For example, in C#, the code to achieve this could look as follows:

```csharp
try {
    mfs.AddParameter("username", "admin");
    mfs.AddParameter("password", "dj9JaVax");
    mfs.WorkingDirectory = "C:\Work";
    if (mfs.Run("C:\Work\mapping.mfx"))
    {
        Console.WriteLine("Success");
    }
    else
    {
        Console.WriteLine(mfs.LastExecutionMessage);
    }
    Console.ReadLine();
}
```

Again, the `username` and `password` (first argument to the `AddParameter` method) must be the same as the names of the respective input parameters on the MapForce mapping.
4 MapForce Server Command Line

MapForce Server provides a command line interface that you can use for administrative tasks such as licensing, and also to run mapping execution files (.mfx). The available commands are listed below.

- **assignlicense**: (Windows only) Uploads a license to LicenseServer and assigns this license to MapForce Server.
- **exportresourcestrings**: Exports all application resource strings to an XML file.
- **help**: Displays information about the command that is submitted as argument (or about all commands if no argument is submitted).
- **licenseserver**: Registers MapForce Server with a LicenseServer on the local network.
- **run**: Runs a Mapping Execution File (.mfx) compiled with MapForce.
- **setdeflang**: Sets the default language of MapForce Server.
- **verifylicense**: (Windows only) Checks if current MapForce Server is licensed and, optionally, whether it is licensed with the given license key.
- **version**: Displays the version number of MapForce Server.

To call MapForce Server at the command line, you need to know the path of the executable as applicable to your operating system. By default, the MapForce Server executable is installed at the following path:

<table>
<thead>
<tr>
<th>OS</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>/opt/Altova/MapForceServer2020/bin/mapforceserver</td>
</tr>
<tr>
<td>macOS</td>
<td>/usr/local/Altova/MapForceServer2020/bin/mapforceserver</td>
</tr>
<tr>
<td>Windows</td>
<td>C:\Program Files\Altova\MapForceServer2020\bin\MapForceServer.exe</td>
</tr>
</tbody>
</table>

**Note:** If MapForce Server 32-bit is installed on Windows 64-bit, change `C:\Program Files` to `C:\Program Files (x86)`.

By convention, this documentation omits the full path of the executable when describing a given command, and uses `mapforceserver` instead of the executable name, for example:

```
mapforceserver help
```

Where `mapforceserver` is the path or name of the executable. Note that, if you use an absolute path, you will be able to run commands regardless of the current directory that your command prompt window (terminal) is in. However, if you would like to call the executable just by typing its name, make sure to do one of the following first:

- Change the terminal's current directory to the MapForce Server installation directory
- Add the directory where the executable is to the PATH environment variable.

Both of these scenarios are described in more detail below.

**Tips and tricks**

If you are new to command line, be aware of the following tips and tricks.

- To find out the current directory where you command line window is, enter `pwd` on Linux and macOS. On Windows, enter `echo %CD%`. 
MapForce Server Command Line

- Make use of the Tab key to quickly enter various file or directory paths without having to type them in full. For example, if you type `cd c:\prog` at the command line, and then press Tab, you will get `C:\Program Files` automatically pre-filled (or perhaps some other directory under C:\ whose name begins with "Prog").
- When entering paths that contain white space, such as `C:\Program Files` on Windows, enclose them within quotes.
- If you see a message similar to "This command is not recognized as an internal or external command, operable program or batch file", you have most likely mistyped a path or command.
- On Linux, make sure that you use the correct case for file or directory names. For example, typing a path such as `/home/nikita/downloads` will return an error if the directory name is actually `/home/nikita/Downloads`.
- When typing a path on Linux or macOS, use forward slashes, as opposed to back slashes on Windows.

How to run a command

1. Open a command prompt window.
   a. To open a command prompt on Windows, press the Windows key and then start typing cmd. Click the Command Prompt suggestion that appears.
   b. To open a terminal on Mac, click the Finder icon, and then select Go > Utilities from the menu. Double-click the Terminal icon in the Utilities window.
   c. If you run Linux from a graphical user interface, locate and run the Terminal command as applicable to your Linux distribution. If you run Linux from a command line interface, ignore this step.

2. Enter the full path to the executable, followed by the command you want to run. For example, the command below provides help at the command line.

   **Linux**
   `/opt/Altova/MapForceServer2020/bin/mapprocesserver help`

   **macOS**
   `/usr/local/Altova/MapForceServer2020/bin/mapprocesserver help`

   **Windows**
   `C:\Program Files (x86)\Altova\MapForceServer2020\bin\MapForceServer.exe help`

In the example above, the command **help** was run without any options or arguments. Other commands may have arguments and options, and those arguments and options could be mandatory or optional. For example, the **run** command has a mandatory argument that lets you supply the path or file name of the .mfx file to be run. Check the reference section for details about each command.

Calling MapForce Server in the installation directory

To call the executable without having to type the full path, change the current directory to the directory where the MapForce Server executable was installed, for example:

   **Linux**
   `cd /opt/Altova/MapForceServer2020/bin`

   **macOS**
   `cd /usr/local/Altova/MapForceServer2020/bin`

   **Windows**
   `cd "C:\Program Files (x86)\Altova\MapForceServer2020\bin\MapForceServer.exe"`
You can now run any command by typing just the executable name, for example:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>./mapforceserver help</td>
</tr>
<tr>
<td>macOS</td>
<td>./mapforceserver help</td>
</tr>
<tr>
<td>Windows</td>
<td>MapForceServer.exe help</td>
</tr>
</tbody>
</table>

**Note:** On Linux and macOS systems, the prefix `./` indicates that the executable is in the current directory.

**Calling MapForce Server from any directory**

To call the executable from any directory, refer to it using the absolute path. Alternatively, if you want to call the program by typing just the executable name, you can edit the PATH environment variable of your operating system so that it includes the full path to the MapForce Server installation directory. There are various ways to change the PATH, below are some examples:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>export PATH=$PATH:/opt/Altova/MapForceServer2020/bin</td>
</tr>
<tr>
<td>macOS</td>
<td>Edit the <strong>etc/paths</strong> file to include the following path: /usr/local/Altova/MapForceServer2020/bin</td>
</tr>
<tr>
<td>Windows</td>
<td>SETX PATH &quot;C:\Program Files (x86)\Altova\MapForceServer2020\bin;%PATH%&quot;</td>
</tr>
</tbody>
</table>

**Note:** For the changes to take effect, you may need to close the terminal window and open a new one.
4.1 assignlicense (Windows only)

Syntax and description

The assignlicense command is available on Windows only (not on Linux or Mac systems). It uploads a license file to the Altova LicenseServer with which MapForce Server is registered (see the licenseserver command), and assigns the license to MapForce Server. It takes the path of a license file as its argument. The command also allows you to test the validity of a license.

```
mapforceserver assignlicense [options] FILE
```

- The FILE argument takes the path of the license file.
- The --test-only option uploads the license file to LicenseServer and validates the license, but does not assign the license to MapForce Server.

For details about licensing, see the LicenseServer documentation (https://www.altova.com/manual/AltovaLicenseServer/).

▼ Casing and slashes on the command line

- **MapForceServer on Windows**
- **mapforceserver on Windows and Unix (Linux, Mac)**

* Note that lowercase (mapforceserver) works on all platforms (Windows, Linux, and Mac), while upper-lower (MapForceServer) works only on Windows and Mac.
* Use forward slashes on Linux and Mac, backslashes on Windows.

▼ Backslashes and spaces on Windows systems

On Windows systems: When spaces occur (for example in file or folder names, or company, person or product names), use quotes: for example, "My File". Note, however, that a backslash followed by a double-quotation mark (for example, "C:\My directory\") might not be read correctly. This is because the backslash character is also used to indicate the start of an escape sequence, and the escape sequence \" stands for the double-quotation mark character. If you want to escape this sequence of characters, use a preceding backslash, like this: \\". To summarize: If you need to write a file path that contains spaces and an end backslash, write it like this: "C:\My Directory\\".

Examples

Examples of the assignlicense command:

```
mapforceserver assignlicense C:\licensepool\mylicensekey.lic
mapforceserver assignlicense --test-only=true C:\licensepool\mylicensekey.lic
```

- The first command above uploads the specified license to LicenseServer and assigns it to MapForce Server.
- The last command uploads the specified license to LicenseServer and validates it, without assigning it to MapForce Server.
Options
Options are listed in short form (if available) and long form. You can use one or two dashes for both short and long forms. An option may or may not take a value. If it takes a value, it is written like this: `--option=value`. Values can be specified without quotes except in two cases: (i) when the value string contains spaces, or (ii) when explicitly stated in the description of the option that quotes are required. If an option takes a Boolean value and no value is specified, then the option's default value is `TRUE`. Use the `--h, --help` option to display information about the command.

▼ test-only [t]
  `--t, --test-only = true|false`
  Values are `true|false`. If `true`, then the license file is uploaded to LicenseServer and validated, but not assigned.
4.2 exportresourcestrings

Syntax and description

The `exportresourcestrings` command outputs an XML file containing the resource strings of the MapForce Server application in the specified language. Available export languages are English (en), German (de), Spanish (es), French (fr), and Japanese (ja).

```
mapforceserver exportresourcestrings [options] LanguageCode XMLOutputFile
```

- The `LanguageCode` argument gives the language of the resource strings in the output XML file; this is the export language. Allowed export languages (with their language codes in parentheses) are: English (en), German (de), Spanish (es), French (fr), and Japanese (ja).
- The `XMLOutputFile` argument specifies the path and name of the output XML file.

How to create localizations is described below.

▼ Casing and slashes on the command line

- `MapForceServer` on Windows
- `mapforceserver` on Windows and Unix (Linux, Mac)

   * Note that lowercase (`mapforceserver`) works on all platforms (Windows, Linux, and Mac), while upper-lower (`MapForceServer`) works only on Windows and Mac.
   * Use forward slashes on Linux and Mac, backslashes on Windows.

▼ Backslashes and spaces on Windows systems

On Windows systems: When spaces occur (for example in file or folder names, or company, person or product names), use quotes: for example, "My File". Note, however, that a backslash followed by a double-quotation mark (for example, "C:\My directory\") might not be read correctly. This is because the backslash character is also used to indicate the start of an escape sequence, and the escape sequence \" stands for the double-quotation mark character. If you want to escape this sequence of characters, use a preceding backslash, like this: \\". To summarize: If you need to write a file path that contains spaces and an end backslash, write it like this: "C:\My Directory\".

Examples

Examples of the `exportresourcestrings` command:

```
mapforceserver exportresourcestrings de c:\Strings.xml
```

- The command above creates a file called `Strings.xml` at `c:\` that contains the resource strings of MapForce Server in German.

Creating localized versions of MapForce Server

You can create a localized version of MapForce Server for any language of your choice. Five localized versions (English, German, Spanish, French, and Japanese) are already available in the `C:\Program Files (x86)\Altova\MapForceServer2020\bin` folder, and therefore do not need to be created.
Create a localized version as follows:

1. Generate an XML file containing the resource strings by using the `exportresourcestrings` command (see command syntax above). The resource strings in this XML file will be one of the five supported languages: English (en), German (de), Spanish (es), French (fr), or Japanese (ja), according to the `LanguageCode` argument used with the command.

2. Translate the resource strings from one of the five supported languages into the target language. The resource strings are the contents of the `<string>` elements in the XML file. Do not translate variables in curly brackets, such as `{option}` or `{product}`.

3. Contact Altova Support to generate a localized MapForce Server DLL file from your translated XML file.

4. After you receive your localized DLL file from Altova Support, save the DLL in the `C:\Program Files (x86)\Altova\MapForceServer2020\bin` folder. Your DLL file will have a name of the form `MapForceServer2020_lc.dll`. The `_lc` part of the name contains the language code. For example, in `MapForceServer2020_de.dll`, the `de` part is the language code for German (Deutsch).

5. Run the `setdeflang` command to set your localized DLL file as the MapForce Server application to use. For the argument of the `setdeflang` command, use the language code that is part of the DLL name.

**Note:** Altova MapForce Server is delivered with support for five languages: English, German, Spanish, French, and Japanese. So you do not need to create a localized version of these languages. To set any of these languages as the default language, use MapForce Server's `setdeflang` command.
4.3 help

Syntax and description
The help command takes a single argument (Command), which is the name of the command for which help is required. It displays the command's syntax, its options, and other relevant information. If the Command argument is not specified, then all commands of the executable are listed, with each having a brief text description.

mapforceserver help Command

▼ Casing and slashes on the command line
MapForceServer on Windows
mapforceserver on Windows and Unix (Linux, Mac)

* Note that lowercase (mapforceserver) works on all platforms (Windows, Linux, and Mac), while upper-lower (MapForceServer) works only on Windows and Mac.
* Use forward slashes on Linux and Mac, backslashes on Windows.

Example
Example of the help command to display information about the licenserver command:

mapforceserver help licenserver

The --help option
Help information about a command is also available by using the --help option of the command for which help information is required. The two commands below produce the same results:

mapforceserver licenseserver --help

The command above uses the --help option of the licenseserver command.

mapforceserver help licenseserver

The help command takes licenseserver as its argument.

Both commands display help information about the licenseserver command.
4.4 licenseserver

Syntax and description
The licenseserver command registers MapForce Server with the Altova LicenseServer specified by the Server-Or-IP-Address argument. For the licenseserver command to be executed successfully, the two servers (MapForce Server and LicenseServer) must be on the same network and LicenseServer must be running. You must also have administrator privileges in order to register MapForce Server with LicenseServer.

mapforceserver licenseserver [options] Server-Or-IP-Address

- The Server-Or-IP-Address argument takes the name or IP address of the LicenseServer machine.
- To request an evaluation license for MapForce Server, submit appropriate values for the --company, --email, and --name options. To request an evaluation license for an additional Altova product (that is, in addition to MapForce Server), add the --request-eval-license option with a value that is the name of that product. See the list of options below for more information.

Once MapForce Server has been successfully registered with LicenseServer, you will receive a message to this effect. The message will also display the URL of the LicenseServer. You can now go to LicenseServer to assign MapForce Server a license. For details about licensing, see the LicenseServer documentation (https://www.altova.com/manual/AltovaLicenseServer/).

Casing and slashes on the command line
MapForceServer on Windows
mapforceserver on Windows and Unix (Linux, Mac)

* Note that lowercase (mapforceserver) works on all platforms (Windows, Linux, and Mac), while upper-lower (MapForceServer) works only on Windows and Mac.
* Use forward slashes on Linux and Mac, backslashes on Windows.

Backslashes and spaces on Windows systems
On Windows systems: When spaces occur (for example in file or folder names, or company, person or product names), use quotes: for example, "My File". Note, however, that a backslash followed by a double-quotation mark (for example, "C:\My directory\") might not be read correctly. This is because the backslash character is also used to indicate the start of an escape sequence, and the escape sequence " stands for the double-quotation mark character. If you want to escape this sequence of characters, use a preceding backslash, like this: \\". To summarize: If you need to write a file path that contains spaces and an end backslash, write it like this: "C:\My Directory\\".

Examples
Examples of the licenseserver command:

mapforceserver licenseserver DOC.altova.com
mapforceserver licenseserver localhost
mapforceserver licenseserver 127.0.0.1

The commands above specify, respectively, the machine named DOC.altova.com, and the user's machine
(localhost and 127.0.0.1) as the machine running Altova LicenseServer. In each case, the command registers MapForce Server with the LicenseServer on the machine specified. The last command calls the server-executable to execute the command.

Options

Options are listed in short form (if available) and long form. You can use one or two dashes for both short and long forms. An option may or may not take a value. If it takes a value, it is written like this: --option=value. Values can be specified without quotes except in two cases: (i) when the value string contains spaces, or (ii) when explicitly stated in the description of the option that quotes are required. If an option takes a Boolean value and no value is specified, then the option's default value is TRUE. Use the --h, --help option to display information about the command.

json [j]

--j, --json = true|false

Values are true|false. If true, prints the result of the registration attempt as a machine-parsable JSON object.
4.5 run

The run command executes a MapForce Server execution file (.mfx file) supplied as argument. The MapForce Server execution file is created with MapForce; it essentially represents a mapping compiled for server execution.

Any input files required by the mapping are expected to be at the path specified at mapping design time in MapForce. If MapForce Server does not run on the same operating system as MapForce, the input files required by the mapping must be copied to the target machine alongside with the .mfx file, and must be referenced using a relative path. For information about configuring a mapping with respect to relative or absolute paths, refer to MapForce documentation (https://www.altova.com/documentation#mapforce). Other prerequisites may apply, depending on how you designed the mapping, see Preparing Mappings for Server Execution.

If the mapping returns a simple value such as string, this output is written in the stdout (standard output) stream. On the other hand, the success and error messages are available in the stderr (standard error) stream. If you do not want the standard output stream to be displayed on the screen together with the success or error messages, redirect either the standard output or the standard error stream (or both) to files. If neither the stdout nor the stderr streams are redirected, they are both displayed on the screen, combined.

For example, to redirect the standard output stream to a file, use:

```
mapforceserver run MyMapping.mfx > MyOutput.txt
```

To redirect the standard error stream to a file, use:

```
mapforceserver run MyMapping.mfx 2> Diagnostics.log
```

To redirect both streams simultaneously, use:

```
mapforceserver run MyMapping.mfx > MyOutput.txt 2> Diagnostics.log
```

For further information about stream redirection, refer to the documentation of your operating system's command shell.

Syntax

Windows

```
MapForceServer run [options] MfxFile
```

Linux

```
mapforceserver run [options] MfxFile
```

Mac

```
mapforceserver run [options] MfxFile
```

Casing and slashes on the command line

- `MapForceServer on Windows`
- `mapforceserver on Unix (Linux, Mac)`
On Windows systems, avoid using the end backslash and closing quote on the command line \", for example, as in: "C:\My directory\". These two characters are interpreted by the command line parser as a literal double-quotiation mark. Use the double backslash \\ if spaces occur in the command line and you need the quotes (for example: "C:\My Directory\")

### Command options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--catalog</td>
<td>Specifies the absolute path to a root catalog file that is not the installed root catalog file. The default value is the absolute path to the installed root catalog file. Form: --catalog=FILE</td>
</tr>
<tr>
<td>--cert</td>
<td>This option is applicable to MapForce Server running on Linux. It specifies the path to the directory where any certificate files required by the mapping are stored. Form: --certificatespath=DIRECTORY</td>
</tr>
<tr>
<td>--cred</td>
<td>Setting this option is meaningful if the mapping contains credentials that you have defined at mapping design time in MapForce. KEY is the credential name as it was defined in MapForce. VALUE consists of one or more name-value pairs, for example: name1=value1&amp;name2=value2</td>
</tr>
<tr>
<td>--gc</td>
<td>This option is applicable if the mapping consumes Global Resources. It specifies the name of the global resource configuration (alias). This option must be used together with the --globalresourcefile option. Form: --gc=VALUE</td>
</tr>
<tr>
<td>--gr</td>
<td>This option is applicable if the mapping consumes Global Resources. It specifies the path of the global resource definition file. This option must be used together with the --globalresourceconfig option.</td>
</tr>
</tbody>
</table>

* Note that lowercase (mapforceserver) works on all platforms (Windows, Linux, and Mac), while uppercase (MapForceServer) works only on Windows and Mac. * Use forward slashes on Linux and Mac, backslashes on Windows.
MapForce Server Command Line run

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>globalresourceconfig</td>
<td>The language used for displaying messages. Form: --globalresourceconfig FILE.</td>
</tr>
<tr>
<td>--gr FILE</td>
<td>The language used for displaying messages. Form: --lang=VALUE (en, de, ja, es, fr)</td>
</tr>
<tr>
<td>--l LANG</td>
<td>The language used for displaying messages. Form: --l LANG=VALUE (en, de, ja, es, fr)</td>
</tr>
<tr>
<td>--p PARAM</td>
<td>This option is applicable if the mapping was designed to take input parameters. It assigns a value to a parameter defined in the mapping. Form: --p PARAM=ParamName:ParamValue. The --p PARAM switch must be used before each parameter. Use quotes if ParamName or ParamValue contains a space. For example: --p=company:&quot;Nanonull Inc&quot;. For more information about mappings that take input parameters, refer to MapForce documentation (<a href="https://www.altova.com/documentation#mapforce">https://www.altova.com/documentation#mapforce</a>).</td>
</tr>
<tr>
<td>--taxonomy-package FILE</td>
<td>Specifies the absolute path to an additional XBRL taxonomy package as described in the Taxonomy Packages 1.0 recommendation. The value of FILE gives the location of the taxonomy package. Add the option multiple times to specify more than one taxonomy package. Form: --taxonomy-package=FILE.</td>
</tr>
<tr>
<td>--taxonomy-packages-config-file=FILE</td>
<td>Specifies the path to a configuration file called TaxonomyPackagesConfig.json, used to load XBRL taxonomy packages. This configuration file is updated every time when you add, remove, activate, or deactivate XBRL taxonomy packages from the graphical user interface of Altova XMLSpy, MapForce, or StyleVision. If you have added custom XBRL taxonomy packages using one of the products above, the file is located at C:\Users\Username\Documents\Altova. Form: --taxonomy-packages-config-file=FILE.</td>
</tr>
</tbody>
</table>

Examples

This example shows you how to run a mapping execution file (.mfx) with MapForce Server on Windows. The mapping used in this example reads an input file, Employees.xml, and produces two output files (PersonList.xml and Contacts.xml). |

First, let's generate the MapForce Server execution (.mfx) file, as follows:

1. Run MapForce and open the following MapForce design file (.mfd file): C:\Users\Username\Documents\Altova\MapForce2020\MapForceExamples\ChainedPersonList.mfd.
3. When prompted, save the .mfx file to C:\temp directory. This will be the working directory where the mapping will be executed by MapForce Server.

Next, let's open a command line prompt and change the working directory to C:\temp.
Finally, run the following command to execute `ChainedPersonList.mfx`. In this example, MapForce Server is called using an absolute path. (To call it with a relative path, add the executable's path to your system's `PATH` environment variable).

```
"C:\Program Files (x86)\Altova\MapForceServer2020\bin\MapForceServer.exe" run ChainedPersonList.mfx
```

The two output files (`PersonList.xml` and `Contacts.xml`) are generated in the working directory. Importantly, this mapping is configured to use absolute paths, which is why the mapping ran successfully and did not require that the input `Employees.xml` file exists in the working directory. The `Employees.xml` file actually exists in the MapForce Examples folder mentioned above and is referenced through an absolute path. To specify whether paths should be treated as absolute or relative, right-click the mapping in MapForce, select `Mapping Settings`, and then select or clear the `Make paths absolute in generated code` check box. Whenever you change the mapping settings, make sure to re-compile the mapping to `.mfx`. For more information, see `Preparing Mappings for Server Execution`.
4.6 setdeflang

Syntax and description
The setdeflang command (short form is sdl) sets the default language of MapForce Server. Available languages are English (en), German (de), Spanish (es), French (fr), and Japanese (ja). The command takes a mandatory LanguageCode argument.

```
mapforceserver setdeflang [options] LanguageCode
```

- The LanguageCode argument is required and sets the default language of MapForce Server. The respective values to use are: en, de, es, fr, ja.
- Use the --h, --help option to display information about the command.

Casing and slashes on the command line

- MapForceServer on Windows
- mapforceserver on Windows and Unix (Linux, Mac)

- Note that lowercase (mapforceserver) works on all platforms (Windows, Linux, and Mac), while upper-lower (MapForceServer) works only on Windows and Mac.
- Use forward slashes on Linux and Mac, backslashes on Windows.

Examples
Examples of the setdeflang (sdl) command:

```
mapforceserver sdl de
mapforceserver setdeflang es
```

- The first command sets the default language of MapForce Server to German.
- The second command sets the default language of MapForce Server to Spanish.

Options
Use the --h, --help option to display information about the command.
4.7 verifylicense (Windows only)

Syntax and description
The verifylicense command checks whether the current product is licensed. Additionally, the --license-key option enables you to check whether a specific license key is already assigned to the product. This command is supported only on Windows systems. It is not supported on Linux or Mac systems.

mapforceserver verifylicense [options]

- To check whether a specific license is assigned to MapForce Server, supply the license key as the value of the --license-key option.

For details about licensing, see the LicenseServer documentation (https://www.altova.com/manual/AltovaLicenseServer/).

Casing and slashes on the command line
MapForceServer on Windows
mapforceserver on Windows and Unix (Linux, Mac)

* Note that lowercase (mapforceserver) works on all platforms (Windows, Linux, and Mac), while upper-lower (MapForceServer) works only on Windows and Mac.
* Use forward slashes on Linux and Mac, backslashes on Windows.

Examples
Example of the verifylicense command:

mapforceserver verifylicense
mapforceserver verifylicense --license-key=ABCD123-ABCD123-ABCD123-ABCD123-ABCD123

- The first command checks whether MapForce Server is licensed.
- The second command checks whether MapForce Server is licensed with the license key specified with the --license-key option.

Options
Options are listed in short form (if available) and long form. You can use one or two dashes for both short and long forms. An option may or may not take a value. If it takes a value, it is written like this: --option=value. Values can be specified without quotes except in two cases: (i) when the value string contains spaces, or (ii) when explicitly stated in the description of the option that quotes are required. If an option takes a Boolean value and no value is specified, then the option's default value is TRUE. Use the --h, --help option to display information about the command.

license-key [l]

--l, --license-key = Value
Checks whether MapForce Server is licensed with the license key specified as the value of this option.
4.8  version

Syntax and description
The `version` command displays the version number of MapForce Server.

```plaintext
mapforceserver version
```

▼ Casing and slashes on the command line

- **MapForceServer on Windows**
- **mapforceserver on Windows and Unix (Linux, Mac)**

* Note that lowercase (`mapforceserver`) works on all platforms (Windows, Linux, and Mac), while upper-lower (`MapForceServer`) works only on Windows and Mac.
* Use forward slashes on Linux and Mac, backslashes on Windows.

Example
Example of the `version` command:

```plaintext
mapforceserver version
```
5 MapForce Server API

MapForce Server provides an application programming interface (API) that you can access programmatically from your .NET, Java, or COM-based code.

For an introduction to each platform, refer to the following topics:

- .NET Interface
- COM Interface
- Java Interface

For a technical description of the API, refer to the following topics:

- API Reference (COM, .NET)
- API Reference (Java)
5.1 .NET Interface

The .NET interface is built as a wrapper around the COM interface. It is provided as a primary interop assembly signed by Altova and uses the namespace Altova.MapForceServer. During installation, MapForce Server will be registered automatically as a COM server object, so there is no need for a manual registration.

In order to use MapForce Server in your .NET project, add a reference to the Altova.MapForceServer.dll file, as shown below. The Altova.MapForceServer.dll is located in the bin folder of the MapForce Server installation folder. This .dll file is automatically added to the Global Assembly Cache (GAC) during MapForce Server installation.

**Note:** Prior to .NET Framework 4.0, the GAC was located in the %windir%\assembly directory. Starting with .NET Framework 4.0, the GAC is located in the %windir%\Microsoft.NET\assembly directory. The %windir% part represents the Windows operating system directory, typically C:\Windows.

To add a reference to the MapForce Server DLL in a Visual Studio .NET project:

1. With the .NET project open in Visual Studio, click **Project | Add Reference**.

2. On the Browse tab, browse for the folder: `<MapForceServer application folder>/bin`, select the Altova.MapForceServer.dll, and click **OK**.
You can view the structure of the `Altova.MapForceServer` assembly using the Visual Studio Object Browser (to display the Object Browser, click `Object Browser` on the `View` menu).

### 5.1.1 C# Example

The following example illustrates how to run a mapping execution file (.mfx) from C# code. On Windows, the example files are available at the following path: `C:\Program Files\Altova\MapForceServer2020\etc\Examples`.

#### Prerequisites

- MapForce Server is installed and licensed
- If you are creating a new Visual Studio project, add a reference to the MapForce Server assembly (see .NET Interface). You can skip this step if you are running the existing MapForce Server API example, because the example already references the MapForce Server assembly.
- On the `Build` menu of Visual Studio, click `Configuration Manager` and set a correct build platform, for example `Debug | x86` (or `Debug | x64`, if applicable). Do not use "Any CPU" as platform.
- If you have installed MapForce Server 64-bit, then the application which calls the API (such as the sample one below) must also be built for the 64-bit platform in Visual Studio. Also, the path to the MapForce server executable must be adjusted accordingly in the code.

The example solution is in the "Program Files" directory, which requires administrative rights. Either run Visual Studio as administrator, or copy the solution to a different folder where you don't need administrative rights.

#### Running the mapping code

The code below runs three server execution files (.mfx). The table below lists the input files expected by each .mfx file, and the output that will be created after execution.

<table>
<thead>
<tr>
<th>Execution file (.mfx)</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>TokenizeString.mfx</td>
<td>AltovaTools.xml</td>
<td>AltovaToolsFeatures.csv</td>
</tr>
<tr>
<td>SimpleTotal.mfx</td>
<td>ipo.xml</td>
<td>String</td>
</tr>
<tr>
<td>ClassifyTemperatures.mfx</td>
<td>Temperatures.xml</td>
<td>Temperatures_out.xml</td>
</tr>
</tbody>
</table>

If you have Altova MapForce, you can optionally take a look at the original mappings from which the .mfx files were compiled in order to understand them better. These are called `TokenizeString1.mfd`, `SimpleTotal.mfd`, and `ClassifyTemperatures.mfd`, respectively. You can find the mappings in the following directory: `C: \users\<user>\Altova\MapForce2020\MapForceExamples`.

The example below does the following:

- It creates a new instance of `Altova.MapForceServer.Server`. This is the object you will subsequently be working with.
- It sets a working directory where execution takes place. Input files are expected to exist in this directory if you referred to them using a relative path. Output files will also be created in this directory.
(see the table above).

- It runs `TokenizeString.mfx`. The file path is supplied as argument to the `Run` method (notice that the path is relative to the working directory that was set previously). Upon successful execution, a `.csv` file representing the mapping output will be created in the working directory.
- It runs `SimpleTotal.mfx`. Again, the file path is relative to the working directory. This mapping produces a string output, so we call the `GetOutputParameter` method to get the string output.
- It runs `ClassifyTemperatures.mfx`. This mapping expects a parameter as input, which was supplied with the help of the `AddParameter` method.

```csharp
namespace MapForceServerAPI_sample
{
    class Program
    {
        static void Main(string[] args)
        {
            try
            {
                // Create a MapForce Server object

                // Set a working directory - used as a base for relative paths (you may need to adapt the path to the installation folder)
                objMFS.WorkingDirectory = "..\..\..";

                // Default path to the MapForce Server executable is the installation path (same dir with the MapForceServer.dll)
                // In case you moved the binaries on the disk, you need to explicitly set the path to the .exe file
                // objMFS.ServerPath = "C:\\Program Files (x86)\\Altova\\MapForceServer2020\\bin\\MapForceServer.exe";
                // objMFS.ServerPath = "C:\\Program Files\\Altova\\MapForceServer2020\\bin\\MapForceServer.exe";

                System.Console.WriteLine("Running " + objMFS.ProductNameAndVersion + ".
\n");

                // Set global resource file and configuration, if your mapping uses global resources
                // objMFS.SetOption("globalresourcefile", "GlobalResource.xml"); // "gr" can be used as short name for "globalresourcefile"
                // objMFS.SetOption("globalresourceconfig", "Default"); // "gc" can be used as short name for "globalresourceconfig"

                // An example with input and output paths stored inside the MFX file
                System.Console.WriteLine("\nExecuting TokenizeString.mfx...");
                if (objMFS.Run("TokenizeString.mfx"))
                    System.Console.WriteLine("Successfully generated file 'AltovaToolFeatures.csv'.");
                else
                {
                    // execution failed. maybe no write permissions in working directory?
                    Run this program as administrator.
                }
            }
            catch (Exception e)
            {
                System.Console.WriteLine(e.ToString());
            }
        }
    }
}
```
System.Console.WriteLine(objMFS.LastExecutionMessage);
}

//

//----------------------------------------------------------------------------------
// An example creating a simple output so that we can retrieve the result explicitly
System.Console.WriteLine("\nExecuting SimpleTotal.mfx...");
if (objMFS.Run("SimpleTotal.mfx"))
    System.Console.WriteLine("Mapping result is: " +
objMFS.GetOutputParameter("total");
else
{
    // execution failed (e.g. somebody deleted file ipo.xml)
    System.Console.WriteLine(objMFS.LastExecutionMessage);
}

//----------------------------------------------------------------------------------
// an example with parameterized input
// the default of 'lower = 5' gets changed to the value '10'
// mfx reads file Temperatures.xml and writes its output to Temperatures_out.xml.
System.Console.WriteLine("\nExecuting ClassifyTemperatures.mfx with parameter 'lower' set to '10' ...");
objMFS.AddParameter("lower", "10");
if (objMFS.Run("ClassifyTemperatures.mfx"))
    System.Console.WriteLine("File Temperatures_out.xml has been written successfully.");
else
{
    // execution failed. maybe no write permissions in working directory?
    Run this program as administrator.
    System.Console.WriteLine(objMFS.LastExecutionMessage);
}

} catch (System.Runtime.InteropServices.COMException ex)
{
    System.Console.WriteLine("Internal Error - " + ex.Message);
}
}

5.1.2 Visual Basic .NET Example

The following example illustrates how to run a mapping execution file (.mfx) from VB.NET code. On Windows, the example files are available at the following path: C:\Program Files\Altova\MapForceServer2020\etc\Examples.

Prerequisites

- MapForce Server is installed and licensed
If you are creating a new Visual Studio project, add a reference to the MapForce Server assembly (see MapForce Server API .NET Interface). You can skip this step if you are running the existing MapForce Server API example, because the example already references the MapForce Server assembly.

- On the Build menu of Visual Studio, click Configuration Manager and set a correct build platform, for example Debug | x86 (or Debug | x64, if applicable). Do not use "Any CPU" as platform.
- If you have installed MapForce Server 64-bit, then the application which calls the API (such as the sample one below) must also be built for the 64-bit platform in Visual Studio. Also, the path to the MapForce server executable must be adjusted accordingly in the code.

The example solution is in the "Program Files" directory, which requires administrative rights. Either run Visual Studio as administrator, or copy the solution to a different folder where you don't need administrative rights.

Running the mapping code

The code below runs three server execution files (.mfx). The table below lists the input files expected by each .mfx file, and the output that will be created after execution.

<table>
<thead>
<tr>
<th>Execution file (.mfx)</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>TokenizeString.mfx</td>
<td>AltovaTools.xml</td>
<td>AltovaToolsFeatures.csv</td>
</tr>
<tr>
<td>SimpleTotal.mfx</td>
<td>ipo.xml</td>
<td>String</td>
</tr>
<tr>
<td>ClassifyTemperatures.mfx</td>
<td>Temperatures.xml</td>
<td>Temperatures_out.xml</td>
</tr>
</tbody>
</table>

If you have Altova MapForce, you can optionally take a look at the original mappings from which the .mfx files were compiled in order to understand them better. These are called TokenizeString1.mfd, SimpleTotal.mfd, and ClassifyTemperatures.mfd, respectively. You can find the mappings in the following directory: C:\users\<user>\Altova\MapForce2020\MapForceExamples.

The example below does the following:

- It creates a new instance of Altova.MapForceServer.Server. This is the object you will subsequently be working with.
- It sets a working directory where execution takes place. Input files are expected to exist in this directory if you referred to them using a relative path. Output files will also be created in this directory (see the table above).
- It runs TokenizeString.mfx. The file path is supplied as argument to the Run method (notice that the path is relative to the working directory that was set previously). Upon successful execution, a .csv file representing the mapping output will be created in the working directory.
- It runs SimpleTotal.mfx. Again, the file path is relative to the working directory. This mapping produces a string output, so we call the GetOutputParameter method to get the string output.
- It runs ClassifyTemperatures.mfx. This mapping expects a parameter as input, which was supplied with the help of the AddParameter method.

Option Explicit On

Module Program
Sub Main()

Try 'Create a MapForce Server object;

    'Set a working directory - used as a base for relative paths for the MapForce server execution (.mfx) file.
    'objMFS.WorkingDirectory = "C:\Program Files (x86)\Altova\MapForceServer2020\etc\Examples"
    objMFS.WorkingDirectory = "..\..\.."

    'Default path to the MapForce Server executable is the installation path (same dir with the MapForceServer.dll)
    'In case you moved the binaries on the disk, you need to explicitly set the path to the .exe file
    'objMFS.ServerPath = "C:\Program Files (x86)\Altova\MapForceServer2020\bin\MapForceServer.exe"
    'objMFS.ServerPath = "C:\Program Files\Altova\MapForceServer2020\bin\MapForceServer.exe"

    'Set global resource file and configuration, if your mapping uses global resources
    'objMFS.SetOption("globalresourcefile", "GlobalResource.xml") '"gr" can be used as short name for "globalresourcefile"
    'objMFS.SetOption("globalresourceconfig", "Config2") '"gc" can be used as short name for "globalresourceconfig"

    '-------------------------------------------------------------------------------
    '-'An example with input and output paths stored inside the MFX file
    System.Console.WriteLine(vbCrLf & "Executing TokenizeString.mfx...")
    If (objMFS.Run("TokenizeString.mfx")) Then
        System.Console.WriteLine("Successfully generated file 'AltovaToolFeatures.csv'.")
    Else 'execution failed. maybe no write permissions in working directory? Run this program as administrator.
        System.Console.WriteLine(objMFS.LastExecutionMessage)
    End If
    '-------------------------------------------------------------------------------
    '-'An example creating a simple output so that we can retrieve the result explicitly
    System.Console.WriteLine(vbCrLf & "Executing SimpleTotal.mfx...")
    If (objMFS.Run("SimpleTotal.mfx")) Then
        System.Console.WriteLine("Mapping result is: " & objMFS.GetOutputParameter("total"))
    Else 'execution failed (e.g. somebody deleted file ipo.xml)
        System.Console.WriteLine(objMFS.LastExecutionMessage)
    End If

End Try

End Sub
End If

'-----------------------------------------------
------
'an example with parameterized input
' the default of 'lower=5' gets changed to the value '10'
'mfx reads file Temperatures.xml and writes its output to
Temperatures_out.xml.
System.Console.WriteLine(vbCrLf & "Executing ClassifyTemperatures.mfx with
parameter 'lower' set to '10' ...")
objMFS.AddParameter("lower", "10")
If (objMFS.Run("ClassifyTemperatures.mfx")) Then
    System.Console.WriteLine("File Temperatures_out.xml has been written
successfully.")
Else
    'execution failed. maybe no write permissions in working directory? Run
this program as administrator.
    System.Console.WriteLine(objMFS.LastExecutionMessage)
End If

Catch ex As Exception
End Try

End Sub

End Module
5.2 COM Interface

MapForce Server is automatically registered as a COM server object during installation. To check whether the registration was successful, open the Registry Editor (for example, by typing `regedit.exe` command at the command line). If registration was successful, the Registry will contain the classes `MapForce.Server`. These two classes will typically be found under `HKEY_LOCAL_MACHINE\SOFTWARE\Classes`.

Once the COM server object is registered, you can invoke it from within applications and scripting languages that have programming support for COM calls. If you wish to change the location of the MapForce Server installation package, it is best to uninstall MapForce Server and then reinstall it at the required location. In this way, the necessary de-registration and registration are carried out by the installer process.

5.2.1 C++ Example

The following example illustrates how to run a mapping execution file (.mfx) from C++ code. On Windows, the example files are available at the following path: `C:\Program Files\Altova\MapForceServer2020\etc\Examples`.

Prerequisites

Before running the code below, ensure the following prerequisites are met:

- MapForce Server is installed and licensed
- MapForce Server is available as a COM server object (normally, this process takes place automatically during MapForce Server installation; to check if registration was successful, see About the COM Interface).

Running the mapping code

The code below runs three server execution files (.mfx). The table below lists the input files expected by each .mfx file, and the output that will be created after execution.

<table>
<thead>
<tr>
<th>Execution file (.mfx)</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>TokenizeString.mfx</td>
<td>AltovaTools.xml</td>
<td>AltovaToolsFeatures.csv</td>
</tr>
<tr>
<td>SimpleTotal.mfx</td>
<td>ipo.xml</td>
<td>String</td>
</tr>
<tr>
<td>ClassifyTemperatures.mfx</td>
<td>Temperatures.xml</td>
<td>Temperatures_out.xml</td>
</tr>
</tbody>
</table>

If you have Altova MapForce, you can optionally take a look at the original mappings from which the .mfx files were compiled in order to understand them better. These are called `TokenizeString1.mfd`, `SimpleTotal.mfd`, and `ClassifyTemperatures.mfd`, respectively. You can find the mappings in the following directory: `C:\users\<user>\Altova\MapForce2020\MapForceExamples`.

The example below does the following:

- It creates a new instance of `Altova.MapForceServer.Server`. This is the object you will subsequently be working with.
- It sets a working directory where execution takes place. Input files are expected to exist in this directory.
directory if you referred to them using a relative path. Output files will also be created in this directory (see the table above).

- It runs **TokenizeString.mfx**. The file path is supplied as argument to the `Run` method (notice that the path is relative to the working directory that was set previously). Upon successful execution, a .csv file representing the mapping output will be created in the working directory.
- It runs **SimpleTotal.mfx**. Again, the file path is relative to the working directory. This mapping produces a string output, so we call the `GetOutputParameter` method to get the string output.
- It runs **ClassifyTemperatures.mfx**. This mapping expects a parameter as input, which was supplied with the help of the `AddParameter` method.

```cpp
// MapForceServerAPI_sample.cpp : Defines the entry point for the console application.
//
#include <iostream>
#include "atlbase.h"

#ifndef __WIN64
// 32-bit MapForce Server
#include "progid:MapForce.Server"
#else
// 64-bit MapForce Server
#include "progid:MapForce_x64.Server"
#endif

int _tmain(int argc, _TCHAR* argv[])
{
    CoInitialize(NULL);

    try
    {
    // Create a MapForce Server object
        MapForceServerLib::IServerPtr pMFS;
        CoCreateInstance(__uuidof(MapForceServerLib::Server), NULL, CLSCTX_ALL,
        __uuidof(MapForceServerLib::IServer), reinterpret_cast<void*>( &pMFS ));

        // Set a working directory - used as a base for relative paths (you may need to
        // adapt the path to the installation folder)
        pMFS->WorkingDirectory = ".."; // this is relative to this applications' working
directory (the project folder)

        // Default path to the MapForce Server executable is the installation path (same
dir with the MapForceServer.dll)
        // In case you moved the binaries on the disk, you need to explicitly set the path
to the .exe file
        // pMFS->ServerPath = "C:\Program Files (x86)\Altova\MapForceServer2020\bin\MapForceServer.exe";
        // pMFS->ServerPath = "C:\Program Files\Altova\MapForceServer2020\bin\MapForceServer.exe";

        // Set global resource file and configuration, if your mapping uses global resources
        // pMFS->SetOption( "globalresourcefile", "GlobalResource.xml" ); // "gr" can be
        // used as short name for "globalresourcefile"
        // pMFS->SetOption( "globalresourceconfig", "Default" ); // "gc" can be used as
```
short name for "globalresourceconfig"

//

// An example with input and output paths stored inside the MFX file

// an example with parameterized input
// the default of 'lower = 5' gets changed to the value '10'
// mfx reads file Temperatures.xml and writes its output to Temperatures_out.xml.
std::cout << "\nExecuting ClassifyTemperatures.mfx with parameter 'lower' set to '10' ..." << std::endl;
pMFS->AddParameter("lower", "10");
if ( pMFS->Run( "ClassifyTemperatures.mfx" ) )
    std::cout << "File Temperatures_out.xml has been written successfully." << std::endl;
else
{
    // execution failed. maybe no write permissions in working directory? Run this
    // program as administrator.
    std::cout << pMFS->LastExecutionMessage << std::endl;
}
}

catch ( _com_error& err )
{
    BSTR  bstrMessage;
    (err).ErrorInfo()->GetDescription( &bstrMessage );
    std::cout << "Exception occurred: " << std::endl;
    
}
5.2.2  VBScript Example

The following example illustrates how to run a mapping execution file (.mfx) from VBScript code. On Windows, the example files are available at the following path: C:\Program Files\Altova\MapForceServer2020\etc\Examples.

Before running the code below, ensure the following prerequisites are met:

- MapForce Server is installed and licensed
- MapForce Server is available as a COM server object (normally, this process takes place automatically during MapForce Server installation; to check if registration was successful, see About the COM Interface).

```vbnet
Option Explicit

REM This script produces extensive output.
REM It is best called from a cmd.exe console with "cscript MapForceServerAPI_sample.vbs"

' Create the MapForce Server object
Dim objMFS
' Since we load a COM-DLL we need care about the process architecture
On Error Resume Next  ' ignore any COM errors avoiding uncontrolled script termination
Dim WshShell
Dim WshProcEnv
Set WshShell = CreateObject("WScript.Shell")
Set WshProcEnv = WshShell.Environment("Process")
Dim process_architecture
process_architecture= WshProcEnv("PROCESSOR_ARCHITECTURE")
If process_architecture = "x86" Then
    Set objMFS = WScript.GetObject( "", "MapForce.Server" )
    If Err.Number <> 0 then
        WScript.Echo("You are running in a 32-bit process but MapForce Server COM-API 32-bit seems not to be installed on your system.")
        WScript.Quit -1
    End If
Else
    Set objMFS = WScript.GetObject( "", "MapForce_x64.Server" )
    If Err.Number <> 0 then
        WScript.Echo("You are running in a 64-bit process but MapForce Server COM-API 64-bit seems not to be installed on your system.")
        WScript.Echo("If you have installed 32-bit MapForce Server consider calling your script from the 32-bit console 'C:\Windows\SysWOW64\cmd.exe.'")
```
WScript.Quit -1
End If
End If
On Error Goto 0  ' re-enable default error promotion

'Set a working directory - used as a base for relative paths (you may need to adapt the
path to the installation folder)
REM objMFS.WorkingDirectory = "C:\Program Files (x86)
\Altova\MapForceServer2020\etc\Examples"
Dim currDir
Dim fso
Set fso = CreateObject("Scripting.FileSystemObject")
currDir = fso.GetParentFolderName(Wscript.ScriptFullName)
'set working folder to parent of this script
objMFS.WorkingDirectory = fso.GetParentFolderName( currDir )

'Default path to the MapForce Server executable is the installation path (same dir with
the MapForceServer.dll)
'In case you moved the binaries on the disk, you need to explicitly set the path to the
.exe file
'objMFS.ServerPath = "C:\Program Files (x86)
\Altova\MapForceServer2020\bin\MapForceServer.exe"

'Set global resource file and configuration, if your mapping uses global resources

5.2.3 VBA Example

Microsoft Visual Basic for Applications (VBA) is primarily used for automating tasks in Microsoft Office. However, it is also possible to call the MapForce Server API from VBA and execute mappings. The following instructions have been tested on MapForce Server and the VBA for Microsoft Office 2013. Instructions may differ if you are using another VBA development environment.

Prerequisites
Before you can call the MapForce Server API functions from your VBA project, note the following prerequisites:

1. Microsoft Office and MapForce Server must be installed on the same machine.
2. The architecture of MapForce Server (32-bit or 64-bit) must match that of Microsoft Office. For example, if you run VBA on Microsoft Office 32-bit, make sure that you use MapForce Server 32-bit. To find out whether your Office product runs on 64-bit, click the File tab, click Account, and then click "About Excel" (or "About Word").
3. The MapForce Server library must be referenced from your VBA project (see instructions below).

How to add a reference to the MapForce Server Library from your VBA project

1. In a macro-enabled Microsoft Office document (.docm, .xlsm), on the Developer tab, click Visual Basic.

By default, the Developer tab is not enabled in Microsoft Office. To enable the Developer tab in an Office 2013 program, right-click the ribbon and select Customize the Ribbon from the context menu. Then, in the Options dialog box, select the Developer check box under "Main Tabs".

2. In the VBA development environment, in the Tools menu, click References.
3. Click to select the **MapForce Server Type Library**.

**How to call the MapForce Server API**

Once you have added a reference to the MapForce Server Library in your VBA project, you can enter the VBA code in the Code Editor window. For example, the following sample code calls MapForce Server and runs a mapping executable file (*mapping.mfx*) that takes an input parameter called "outfile" having the value "output.csv".

```vba
Sub RunMapping()
  ' Create a new instance of the MapForce Server
  Dim objMFS As New MapForceServerLib.Server
  With objMFS
    ' Set the working directory
    ' (used as base if the mapping has relative paths)
    .WorkingDirectory = "C:\temp\"
    ' If the mapping has parameters, supply them
    Call .AddParameter("outfile", "output.csv")
    ' Run the mapping
    .Run ("C:\temp\mapping.mfx")
  End With
End Sub
```

Press **F5** to debug the VBA code and run the mapping.
Sub RunMapping()
    ' Create a new instance of the MapForce Server
    Dim objMFS As New MapForceServerLib.Server
    With objMFS
        ' Set the working directory
        .WorkingDirectory = "C:\temp\"
        ' If the mapping has parameters, supply them
        Call .AddParameter("outfile", "output.csv")
        ' Run the mapping
        .Run("C:\temp\mapping.mfx")
    End With
End Sub
5.3 Java Interface

To access the MapForce Server API from Java, a reference to MapForceServer.jar library must be added to the Java CLASSPATH. You can find the MapForceServer.jar file in the bin folder of the MapForce Server installation folder. You can either reference the file from its original location or copy it to another location if this fits your project setup.

If you are using Eclipse as Java development environment, you can add the required library reference to the CLASSPATH is by editing the properties of the Java project, as shown below. Optionally, you can also attach documentation in JavaDoc format to the .jar library. You can find the JavaDoc in the bin folder of the MapForce Server installation folder; the instructions below illustrate how to make the JavaDoc documentation visible from Eclipse.

To add a reference to the MapForce Server library:

1. With the project open in Eclipse, on the Project menu, click Properties.
2. Click Java Build Path.
3. On the Libraries tab, click Add External JARs, and then browse for the MapForceServer.jar file located in the MapForce Server installation folder.

4. Optionally, to add the Javadoc archive, expand the MapForceServer.jar record, and then double-click the Javadoc location: (None) record.
5. Ensure that the **Javadoc in archive** and **External file** options are selected, and then browse for the `MapForceServer_JavaDoc.zip` file located in the MapForce Server installation folder.

6. Click OK.

Below is an example of how the Eclipse .classpath file might look if you are referencing the files from the original installation folder, on a 64-bit Windows running 64-bit MapForce Server (the relevant lines are highlighted in yellow):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<classpath>
    <classpathentry kind="src" path=""/>
    <classpathentry kind="lib" path="C:\Program Files\Altova\MapForceServer2019\bin\M"/>
</classpath>
```
5.3.1 Java Example

The following example illustrates how to run a mapping execution file (.mfx) from Java code. On Windows, all the example files are available at the following path: `C:\Program Files\Altova\MapForceServer2020\etc\Examples`. They are as follows:

- **TokenizeString.mfx** - A MapForce Server execution file that will be run by the Java program.
- **AltovaTools.xml** - An XML file that provides input data to the mapping program.

On Linux and Mac platforms, no examples are pre-installed; however, you can prepare an executable .mfx file like the one run in this example as follows:

1. Open the desired mapping design file (.mfd) with MapForce on Windows.
2. On the **File** menu, select **Mapping Settings**, and clear the **Make paths absolute in generated code** check box if it is selected.
3. For each mapping component, open the **Properties** dialog box (by double-clicking the component's title bar, for example), and change all file paths from absolute to relative. Also, select the **Save all file paths relative to MFD file** check box. For convenience, you can copy all input files and schemas in the same folder as the mapping itself, and reference them just by the file name. Refer to MapForce documentation for more information about dealing with relative and absolute paths while designing mappings.
4. On the **File** menu, select **Compile to MapForce Server Execution file**. This generates the .mfx file that you will subsequently run with MapForce Server, as shown in the code listing below.

### Prerequisites

Before running the code below, ensure the following prerequisites are met:

- MapForce Server is installed and licensed
- The Java CLASPATH includes a reference to the **MapForceServer.jar** library (for an example, see About the Java Interface).

If you are using a custom .mfx file as shown above, there may be other prerequisites, depending on the kind of data processed by the mapping. For more information, see Preparing Mappings for Server Execution.
On Windows, the example Java project is in the "Program Files" directory, which requires administrative rights. You will either need to run your Java development environment (for example, Eclipse) as administrator, or copy the example to a different folder where you don't need administrative rights.

Running the Java program

The code listing below first creates a MapForce Server object. Next, it sets the working directory where the application should look for any files that act as input to the mapping, and where it should generate the mapping output files. As mentioned above, the example mapping file reads data from a source XML file—so make sure that both the XML file and its schema exist in the working directory.

The `setServerPath` method specifies the path to the MapForce Server executable. For example, on Ubuntu, this would be `/opt/Altova/MapForceServer2020/bin/mapforceserver`. You can omit the `setServerPath` if you did not move the `MapForceServer.jar` from its default location.

Finally, the `run` method runs a mapping (.mfx file) that was compiled with MapForce (in this example, `TokenizeString.mfx`). On success, the program below generates a CSV file in the working directory. On error, the program attempts to print out the last execution message generated by MapForce Server.

```java
public class Program {
    public static void main(String[] args) {
        try {
            //Create a MapForce Server object

            //Set a working directory - used as a base for relative paths (you may need to adapt the path to the installation folder)
            objMFS.setWorkingDirectory( "C:\\Program Files (x86)\\Altova\\MapForceServer2020\\etc\\Examples" );

            //Default path to the MapForce Server executable is the installation path (same dir with the MapForceServer.jar)
            //In case you copied the JAR file to a new location, you need to explicitly set the path to the .exe file
            objMFS.setServerPath( "C:\\Program Files (x86)\\Altova\\MapForceServer2020\\bin\\MapForceServer.exe" );

            //Set global resource file and configuration, if your mapping uses global resources
            //objMFS.setOption( "globalresourcefile", "GlobalResource.xml" ); // "gr" can be used as short name for "globalresourcefile"
            //objMFS.setOption( "globalresourceconfig", "Default" ); // "gc" can be used as short name for "globalresourceconfig"

            //Prepare the parameters, if your design uses parameters
            //objMFS.addParameter( "testparam1", "value 1" );
        }
    }
}
```
// Run the mapping; input and output paths are stored inside the MFX file
// NOTE Please adapt the path to the input file in order to run the sample
if ( objMFS.run( "C:\Program Files (x86)\Altova\MapForceServer2020\etc\Examples\TokenizeString.mfx" ) )
    System.out.println( "Success - finished execution" );
else
    System.out.println( objMFS.getLastExecutionMessage() );
}
catch ( Exception e)
{
    e.printStackTrace();
}
System.out.println( "Finished - exiting" );
}
5.4 **Example: Run Mapping with Parameters**

This example shows you how to compile a MapForce mapping to a MapForce Server execution file (.mfx) and run it from the MapForce API. The example specifically illustrates the scenario when the mapping takes the input file name as parameter. See also any of the previous C# 69, C++ 55, VB.NET 41, VBScript 53, or Java 69 examples.

In this example, MapForce is used so that you can view and understand the original mapping design. MapForce is also used to compile the mapping to a MapForce Server execution file (.mfx) and configure settings such as relative versus absolute paths.

The server platform used in the example is Windows. This could be either the same machine where MapForce is installed, or a different one. You can also run this example on a Linux or Mac machine (in Java), provided that you adjust the Windows-style paths as applicable to your platform.

**Prerequisites**

Running this mapping has the same prerequisites as described in the previous C# 69, C++ 55, VB.NET 41, VBScript 53, or Java 69 examples.

**Preparing the mapping for server execution**

After installing MapForce and running MapForce for the first time, several demo mapping design files are available at the following path:

`C:\Users\<username>\Documents\Altova\MapForce2020\MapForceExamples`

Make sure to change the path above accordingly if you have a different version of MapForce.

The mapping design used in this example is called **FileNameAsParameters.mfd**. As illustrated below, this is a straightforward mapping that copies data from a source to a target XML file almost unchanged. Only the **PrimaryKey** and **Name** fields of the target XML file are populated with constants from the mapping.
The mapping has two input parameters: `InputFileName` and `OutputFileName`, respectively. In order to make it possible to preview the mapping in MapForce, the parameter values are supplied by two constants. As further described below, you will be able to replace the parameter values with your own when the mapping runs with MapForce Server.

Notice that both the source and target mapping components are configured to get the file name dynamically from the mapping. Namely, a `File: <dynamic>` input connector is available at the very top of the component, and it reads data from the respective mapping parameter (`InputFileName` or `OutputFileName`). In MapForce, you can set or change this option by clicking the `File/String` button in the top-right corner of the component. Be aware that the input file name supplied as parameter must be a reference to a physical XML file that provides input data to the mapping (in this example, `Altova_Hierarchical.xml` from the same folder as the mapping design file). The output file name can be any valid name, for example `Output.xml`.

Before compiling the mapping to a MapForce Server Execution file (.mfx), you will typically want to review the mapping settings. Right-click on an empty area on the mapping, and select `Mapping Settings` from the context menu.
For the scope of this example, change the settings as illustrated above. Specifically, when you clear the Make paths absolute in generated code check box, any absolute paths to input or output files used by the mapping are resolved as relative to the mapping design file (.mfd). At mapping runtime, MapForce Server will look for these paths in the program's working directory. The default working directory depends on the platform that you use to access the MapForce Server API. For example, in case of a C# application, it is the same directory as the executable. In addition, as further illustrated below, you can change the working directory with the help of an API property called WorkingDirectory (or setWorkingDirectory Java method, if applicable).

Notes:

- On the Mapping Settings dialog box, the only settings that directly affect the compilation of the .mfx file are Make paths absolute in generated code and Line ends.
- In this mapping, we did not need to edit each mapping component in MapForce so as to change absolute paths to relative because all paths were already relative. Otherwise, you would need to perform this extra step as well, see Preparing Mappings for Server Execution.

In this example, we will use C:\MappingExample as working directory. Therefore, copy the input file Altova_Hierarchical.xml referenced by the mapping to from C:\Users\<username>\Documents\Altova\MapForce2020\MapForceExamples to the working directory.

In this example, both the source and target are XML files, and there is no need to copy the XML schema file to the server, because information derived from it is embedded into the .mfx file during compilation. If your mapping uses other component types (for example, databases), there could be additional prerequisites, as described in Preparing Mappings for Server Execution.

Finally, to compile the mapping to a server execution file, do the following:

- On the File menu, click Compile to MapForce Server Execution file and select a target directory. In this example, the target directory is the same as working directory, C:\MappingExample.
The following code listings illustrate how to run the mapping from various environments, using the MapForce Server API. In the code listings below, notice that both parameters are referenced by the same name that they have in the mapping design. Also, the parameter value has the same data type as defined on the mapping (in this case, string).

Running the mapping from C++
You can now run the .mfx file by using C++ code such as the one below. To run this code listing successfully, make sure that MapForce Server has a valid license, see also the verifylicense CLI command.

C++

```cpp
#include <iostream>
#include "atlbase.h"

// 32-bit MapForce Server
#include "progid:MapForce.Server"

int _tmain(int argc, _TCHAR* argv[])
{
    CoInitialize(NULL);

    try
    {
        //Create a MapForce Server object
        MapForceServerLib::IServerPtr pMFS;
        CoCreateInstance(__uuidof(MapForceServerLib::Server), NULL, CLSCTX_ALL,
        __uuidof(MapForceServerLib::IServer), reinterpret_cast<void**>( &pMFS ));

        //Set a working directory - used as a base for relative paths
        pMFS->WorkingDirectory = "C:\MappingExample";

        //Prepare the parameters
        pMFS->AddParameter("InputFileName", "Altova_Hierarchical.xml");
        pMFS->AddParameter("OutputFileName", "Output.xml");

        //Run the mapping
        if (pMFS->Run("FileNamesAsParameters.mfx"))
            std::cout << "Success - finished execution" << std::endl;
        else
            std::cout << pMFS->LastExecutionMessage << std::endl;
    }
    catch (_com_error& err )
    {
        BSTR bstrMessage;
        (err).ErrorInfo()->GetDescription( &bstrMessage );
        std::cout << "Exception occurred: " << _com_util::ConvertBSTRToString( bstrMessage ) << std::endl;
    }

    CoUninitialize();
    return 0;
}
```
Running the mapping from C#

You can now run the .mfx file by using C# code such as the one below. To run this code listing successfully, first add a reference to the MapForce Server DLL in Visual Studio, as described in .NET Interface, and make sure that MapForce Server has a valid license, see also the verifylicense CLI command.

```csharp
static void Main(string[] args)
{
    try
    {
        // Create a MapForce Server object

        // Set the working directory - all relative paths will be resolved against it
        objMFS.WorkingDirectory = "C:\\MappingExample";

        // Prepare the parameters
        objMFS.AddParameter("InputFileName", "Altova_Hierarchical.xml");
        objMFS.AddParameter("OutputFileName", "Output.xml");

        // Run the mapping
        if (objMFS.Run("FileNamesAsParameters.mfx"))
            System.Console.WriteLine("Success - finished execution");
        else
            System.Console.WriteLine(objMFS.LastExecutionMessage);
    }
    catch(System.Runtime.InteropServices.COMException ex)
    {
        System.Console.WriteLine("Internal Error: " + ex.Message);
    }
}
```

Running the mapping from Java

You can now run the .mfx file by using Java code such as the one below. To run this code listing successfully, make sure that:

- the Java CLASSPATH environment variable includes a reference to the MapForceServer.jar library, as described in About the Java Interface, and MapForce Server has a valid license, see also the verifylicense CLI command.

```java
public static void main(String[] args) {
    try {
        // Create a MapForce Server object
```
// Set the working directory - all relative paths will be resolved against it
// objMFS.setWorkingDirectory("/home/ubuntu/Downloads/MappingExample");
objMFS.setWorkingDirectory("C:\\MappingExample");

// Add the mapping parameters
objMFS.addParameter("InputFileName", "Altova_Hierarchical.xml");
objMFS.addParameter("OutputFileName", "Output.xml");

// Run the mapping
if ( objMFS.run( "FileNamesAsParameters.mfx" ) )
    System.out.println( "Success - finished execution" );
else
    System.out.println( objMFS.getLastExecutionMessage() );

} catch (Exception e) {
    e.printStackTrace();
}

System.out.println("Finished execution");
5.5 API Reference (COM, .NET)

This section provides general reference to the MapForce Server API elements (such as interfaces and methods) applicable to code written for the COM or .NET platforms.

5.5.1 Interfaces

5.5.1.1 IServer

The IServer interface creates a new MapForce Server object instance, and provides access to the MapForce Server engine.

If you are using C++ under COM platform, the name of the main interface is IServer. If you are using a .NET language such as C# or VB.NET, the name of the main interface is Server.

Properties

## Methods

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| **AddCredentialProperty** ³ | Adds a property to the current credential (for example, the username, the password, or both). The first argument specifies the property name, and the second argument specifies the property value. Valid property names: **username**, **password**. In MapForce Server Advanced Edition, the property name **oauth:token** is additionally supported.  
This method must be called after calling **BeginCredential()** and before calling **EndCredential()**. |
| **AddParameter** ³ | Assigns a value to a parameter defined in the mapping. The first argument specifies the name of the parameter as defined on the mapping; the second argument specifies the parameter value. |
| **BeginCredential** ³ | Creates a new credential with the name supplied as argument. If you call this method, you must also add properties to it using **AddCredentialProperty()**, and finally close the credential by calling **EndCredential()**. |
| **ClearCredentialList** ³ | Clears the list of credentials set previously. All credentials are valid for the lifetime of the object. Call this method if you need to explicitly clear all of the previously set credentials. |
| **ClearOptions** ³ | Clears the list of options previously set through the **SetOption** method. All options set through the **SetOption** method are valid for the lifetime of the object. Call this method if you need to explicitly clear all of the previously set options. |
| **ClearParameterList** ³ | Clears the list of parameters that were previously set using the **AddParameter** method. |

---

© 2020 Altova GmbH
### Name | Description
--- | ---
**EndCredential** | Closes a credential object that was previously created using the BeginCredential method.

**GetOutputParameter** | Gets the string output generated by the last run command. Returns null if no output was generated. This function requires a string parameter which identifies the name of the output component in MapForce.

**Run** | Executes a MapForce Server Execution file (.mfx file). Returns **true** in case of success; **false** otherwise.

**SetOption** | Sets an option before running the mapping. The first argument specifies the name of the option, while the second argument specifies the option value. This method is particularly useful when a mapping was designed to consume Global Resources (see Altova Global Resources). The currently supported options are as follows:

- **globalresourcefile (or gr)** - A Global Resource file path. (When this option is specified, then a Global Resource configuration name must also be specified, see next item).
- **globalresourceconfig (or gc)** - A Global Resource configuration name. (When this option is specified, then a Global Resource file path must also be specified, see previous item).
- **catalog** - The path to a custom RootCatalog.xml file. This option enables you to specify a custom catalog file used to resolve URLs used by the mapping. The default catalog is in the etc subdirectory of the program installation directory.
- **taxonomy-package** - The path to a custom XBRL taxonomy package, if one is required by the mapping.
- **taxonomy-packages-config-file** - The path to a custom XBRL taxonomy package configuration, if one is required by the mapping.

All set options are valid for the lifetime of the object. If you set an option with the same name twice, the previous option will be overridden. To explicitly clear all options, call the ClearOptions() method.

### Examples
See the following examples that illustrate how to initialize and run MapForce Server in various languages:

- **C++ example**
- **C# example**
- **VBScript example**
- **VB.NET example**
5.5.1.1.1 Properties

5.5.1.1.1.1 APIMajorVersion

Gets the major version of the MapForce Server API. This can be different from the product version if the API is connected to another server.

Signature

<table>
<thead>
<tr>
<th>APIMajorVersion : Integer</th>
</tr>
</thead>
</table>

**Generic signature**

```c
int APIMajorVersion { get; }
```

**C#**

```c
HRESULT APIMajorVersion([out, retval] INT* pnVal);
```

**C++**

```c
ReadOnly Property APIMajorVersion As Integer
```

5.5.1.1.1.2 APIMinorVersion

Gets the minor version of the MapForce Server API. This can be different from the product version if the API is connected to another server.

Signature

<table>
<thead>
<tr>
<th>APIMinorVersion : Integer</th>
</tr>
</thead>
</table>

**Generic signature**

```c
int APIMinorVersion { get; }
```

**C#**

```c
HRESULT APIMinorVersion([out, retval] INT* pnVal);
```

**C++**

```c
ReadOnly Property APIMinorVersion As Integer
```
VB.NET

5.5.1.1.3  APIServicePackVersion

Gets the service pack version of the MapForce Server API. This can be different from the product version if the API is connected to another server.

Signature

APIServicePackVersion : Integer

Generic signature

int APIServicePackVersion { get; }

C#

HRESULT APIServicePackVersion([out, retval] INT* pnVal);

C++

ReadOnly Property APIServicePackVersion As Integer

VB.NET

5.5.1.1.4  Is64Bit

Returns true if the MapForce Server engine is a 64-bit executable.

Signature

Is64Bit : Boolean

Generic signature

bool Is64Bit { get; }

C#

HRESULT Is64Bit([out, retval] VARIANT_BOOL* pbVal);

C++

ReadOnly Property Is64Bit As Boolean
5.5.1.1.5  LastExecutionMessage

Gets the message received during the last Run command.

**Signature**

```
string LastExecutionMessage { get; }
```

### VB.NET

```
LastExecutionMessage : String
```

### C#

```
HRESULT LastExecutionMessage([out, retval] BSTR* pbstrResult );
```

### C++

```
ReadOnly Property LastExecutionMessage As String
```

---

5.5.1.1.6  MajorVersion

Gets the major version of the product, as number of years starting from 1998 (for example, "20" for Altova MapForce Server 2018).

**Signature**

```
int MajorVersion { get; }
```

### VB.NET

```
MajorVersion : Integer
```

### C#

```
HRESULT MajorVersion([out, retval] INT* pnVal);
```

### C++

```
ReadOnly Property MajorVersion As Integer
```
**5.5.1.1.7  MinorVersion**

Gets the minor version of the product (for example, "2" for Altova MapForce Server 2018 r2).

**Signature**

```vbnet
MinorVersion : Integer
```

**Generic signature**

```csharp
int MinorVersion { get; }
```

**C++**

```c++
ReadOnly Property MinorVersion As Integer
```

---

**5.5.1.1.8  ProductName**

Gets the name of the product (for example, "Altova MapForce Server").

**Signature**

```vbnet
ProductName : String
```

**Generic signature**

```csharp
string ProductName { get; }
```

**C++**

```c++
ReadOnly Property ProductName As String
```
**VB.NET**

### 5.5.1.1.9  *ProductNameAndVersion*

Gets the complete name and version of the product (for example, “Altova MapForce Server 2018 r2 sp1 (x64)”).

**Signature**

```
ProductNameAndVersion : String
```

**Generic signature**

```
string ProductNameAndVersion { get; }
```

**C#**

```
HRESULT ProductNameAndVersion([out, retval] BSTR* pstrVal);
```

**C++**

```
ReadOnly Property ProductNameAndVersion As String
```

---

**VB.NET**

### 5.5.1.1.10  *ServerPath*

Gets or sets the path of the MapForce Server executable.

**Signature**

```
ServerPath : String
```

**Generic signature**

```
string ServerPath { set; get; }
```

**C#**

```
HRESULT ServerPath([in] BSTR bstrServerFile );
HRESULT ServerPath([out, retval] BSTR* pbstrServerFile );
```

**C++**

```
Property ServerPath As String
```
**VB.NET**

### 5.5.1.1.11 ServicePackVersion

Gets the service pack version of the product (for example, "1" for Altova MapForce Server 2018 r2 sp1).

**Signature**

```plaintext
ServicePackVersion : Integer
```

**Generic signature**

```csharp
int ServicePackVersion { get; }
```

**C#**

```csharp
HRESULT ServicePackVersion([out, retval] INT* pnVal);
```

**C++**

```c++
ReadOnly Property ServicePackVersion As Integer
```

**VB.NET**

### 5.5.1.1.12 WorkingDirectory

Gets or sets the current directory for running jobs (relative paths will be evaluated against the working directory).

**Signature**

```plaintext
WorkingDirectory : String
```

**Generic signature**

```csharp
string WorkingDirectory { set; get; }
```

**C#**

```csharp
HRESULT WorkingDirectory([in] BSTR bstrWorkingDirectory );
HRESULT WorkingDirectory([out, retval] BSTR* pbstrWorkingDirectory );
```

**C++**

```c++
Property WorkingDirectory As String
```
### VB.NET

### 5.5.1.1.2 Methods

#### 5.5.1.1.2.1 AddCredentialProperty

Adds a property to the current credential (for example, the username, the password, or both). The first argument specifies the property name, and the second argument specifies the property value. Valid property names: username, password. In MapForce Server Advanced Edition, the property name oauth:token is additionally supported.

This method must be called after calling `BeginCredential()` and before calling `EndCredential()`.

**Signature**

```
AddCredentialProperty(in bstrName:System.String, in bstrValue:System.String) -> Void
```

**Generic signature**

```
void AddCredentialProperty(string bstrName, string bstrValue)
```

**C#**

```
HRESULT AddCredentialProperty([in] BSTR bstrName, [in] BSTR bstrValue );
```

**C++**

```
Sub AddCredentialProperty(ByVal bstrName As String, ByVal bstrValue As String)
```

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bstrName</td>
<td>System.String</td>
<td>Specifies the name of the credential property.</td>
</tr>
<tr>
<td>bstrValue</td>
<td>System.String</td>
<td>Specifies the value of the credential property.</td>
</tr>
</tbody>
</table>

### Examples

The following code listing illustrates how to declare a credential called "mycredential" in C#. The credential name must be the one given to the credential in MapForce at design time.
//Create a MapForce Server object

objMFS.BeginCredential("mycredential");
objMFS.AddCredentialProperty("username", "altova");
objMFS.AddCredentialProperty("password", "b45ax78!");
objMFS.EndCredential();

5.5.1.1.2.2 AddParameter

Assigns a value to a parameter defined in the mapping. The first argument specifies the name of the parameter as defined on the mapping; the second argument specifies the parameter value.

Signature

AddParameter(in bstrName:String, in bstrValue:String) -> Void

Generic signature

void AddParameter(string bstrName, string bstrValue)

C#)

HRESULT AddParameter([in] BSTR bstrName, [in] BSTR bstrValue);

C++

Sub AddParameter(ByVal bstrName As String, ByVal bstrValue As String)

VB.NET

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bstrName</td>
<td>String</td>
<td>Specifies the parameter name.</td>
</tr>
<tr>
<td>bstrValue</td>
<td>String</td>
<td>Specifies the parameter value.</td>
</tr>
</tbody>
</table>

5.5.1.1.2.3 BeginCredential

Creates a new credential with the name supplied as argument. If you call this method, you must also add properties to it using AddCredentialProperty(), and finally close the credential by calling EndCredential().
### Signature

**BeginCredential**

```
BeginCredential(String bstrCredentialName) -> Void
```

**C#**

```
HRESULT BeginCredential([in] BSTR bstrCredentialName);
```

**C++**

```
Sub BeginCredential(ByVal bstrCredentialName As String)
```

**VB.NET**

```
void BeginCredential(string bstrCredentialName)
```

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bstrCredentialName</td>
<td>String</td>
<td>Specifies the name of the credential as it was defined in MapForce.</td>
</tr>
</tbody>
</table>

### 5.5.1.1.2.4 ClearCredentialList

Clears the list of credentials set previously. All credentials are valid for the lifetime of the object. Call this method if you need to explicitly clear all of the previously set credentials.

### Signature

**ClearCredentialList**

```
ClearCredentialList() -> Void
```

**C#**

```
HRESULT ClearCredentialList();
```

**C++**

```
Sub ClearCredentialList()
```
5.5.1.1.2.5  **ClearOptions**

Clears the list of options previously set through the `SetOption` method. All options set through the `SetOption` method are valid for the lifetime of the object. Call this method if you need to explicitly clear all of the previously set options.

**Signature**

```vbnet
ClearOptions() -> Void
```

**C#**

```csharp
HRESULT ClearOptions();
```

**C++**

```cpp
Sub ClearOptions();
```

5.5.1.1.2.6  **ClearParameterList**

Clears the list of parameters that were previously set using the `AddParameter` method.

**Signature**

```vbnet
ClearParameterList() -> Void
```

**C#**

```csharp
HRESULT ClearParameterList();
```

**C++**

```cpp
Sub ClearParameterList();
```
**VB.NET**

### 5.5.1.1.2.7 EndCredential

Closes a credential object that was previously created using the `BeginCredential` method.

**Signature**

<table>
<thead>
<tr>
<th>EndCredential() -&gt; Void</th>
</tr>
</thead>
</table>

**Generic signature**

<table>
<thead>
<tr>
<th>void EndCredential()</th>
</tr>
</thead>
</table>

**C#**

<table>
<thead>
<tr>
<th>HRESULT EndCredential();</th>
</tr>
</thead>
</table>

**C++**

<table>
<thead>
<tr>
<th>Sub EndCredential()</th>
</tr>
</thead>
</table>

### 5.5.1.1.2.8 GetOutputParameter

Gets the string output generated by the last run command. Returns null if no output was generated. This function requires a string parameter which identifies the name of the output component in MapForce.

**Signature**

<table>
<thead>
<tr>
<th>GetOutputParameter(in bstrName:String) -&gt; String</th>
</tr>
</thead>
</table>

**Generic signature**

<table>
<thead>
<tr>
<th>string GetOutputParameter(string bstrName)</th>
</tr>
</thead>
</table>

**C#**

<table>
<thead>
<tr>
<th>HRESULT GetOutputParameter([in] BSTR bstrName, [out, retval] BSTR* pbstrValue );</th>
</tr>
</thead>
</table>

**C++**

<table>
<thead>
<tr>
<th>Function GetOutputParameter(bstrName As String) As String</th>
</tr>
</thead>
</table>
**VB.NET**

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bstrName</td>
<td>String</td>
<td>Specifies the name of the output component as it appears in MapForce. This name is displayed in the title bar of each component on the mapping (or when you right-click the component header, and select Properties).</td>
</tr>
</tbody>
</table>

**5.5.1.2.9 Run**

Executes a MapForce Server Execution file (.mfx file). Returns `true` in case of success; `false` otherwise.

**Signature**

```java
Run(in bstrMappingPath: String) -> Boolean
```

**C#**

```csharp
HRESULT Run( [in] BSTR bstrMappingPath, [out, retval] VARIANT_BOOL* pbSuccess );
```

**C++**

```cpp
Function Run( ByVal bstrMappingPath As String) As Boolean
```

**VB.NET**

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bstrMappingPath</td>
<td>String</td>
<td>Specifies the path to the MapForce Server execution (.mfx) file. If you specify a relative path, then it will be resolved against the working directory. You can set the</td>
</tr>
</tbody>
</table>
5.5.1.1.2.10  **SetOption**

Sets an option before running the mapping. The first argument specifies the name of the option, while the second argument specifies the option value. This method is particularly useful when a mapping was designed to consume Global Resources (see [Altova Global Resources](#)). The currently supported options are as follows:

- **globalresourcefile (or gr)** - A Global Resource file path. (When this option is specified, then a Global Resource configuration name must also be specified, see next item).

- **globalresourceconfig (or gc)** - A Global Resource configuration name. (When this option is specified, then a Global Resource file path must also be specified, see previous item).

- **catalog** - The path to a custom RootCatalog.xml file. This option enables you to specify a custom catalog file used to resolve URLs used by the mapping. The default catalog is in the etc subdirectory of the program installation directory.

- **taxonomy-package** - The path to a custom XBRL taxonomy package, if one is required by the mapping.

- **taxonomy-packages-config-file** - The path to a custom XBRL taxonomy package configuration, if one is required by the mapping.

All set options are valid for the lifetime of the object. If you set an option with the same name twice, the previous option will be overridden. To explicitly clear all options, call the `ClearOptions()` method.

### Signature

**SetOption**(`in bstrName:String, in bstrValue:String`) -> `Void`

**Generic signature**

```csharp
void SetOption(ByVal bstrName As String, ByVal bstrValue As String)
```

**C#**

```csharp
HRESULT SetOption([in] BSTR bstrName, [in] BSTR bstrValue );
```

**C++**

```csharp
Sub SetOption(ByVal bstrName As String, ByVal bstrValue As String)
```

**VB.NET**

```csharp
```
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bstrName</td>
<td>String</td>
<td>Specifies the name of the option to set.</td>
</tr>
<tr>
<td>bstrValue</td>
<td>String</td>
<td>Specifies the value of the option to set.</td>
</tr>
</tbody>
</table>
5.6 API Reference (Java)

This section provides general reference to the MapForce Server API elements (such as classes and methods) applicable to code written for the Java platform.

5.6.1 Classes

5.6.1.1 MapForceServer

The MapForceServer class creates a new MapForce Server object instance, and provides access to the MapForce Server engine.

Methods

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>addCredentialPropertiesFromMap</td>
<td>Adds properties from a credential property map to the current credential. This method takes as argument a credential property map ( (property_name, property_value) ). This method must be called after calling beginCredential() and before calling endCredential(). As an alternative to calling this method, you can also call AddCredentialProperty().</td>
</tr>
<tr>
<td>addCredentialProperty</td>
<td>Adds a property to the current credential (for example, the username, the password, or both). The first argument specifies the property name, and the second argument specifies the property value. Examples
For an example of creating a new instance of MapForceServer in Java, see the [Java example](#).

5.6.1.1.1 Methods

5.6.1.1.1.1 addCredentialPropertiesFromMap

Adds properties from a credential property map to the current credential. This method takes as argument a credential property map *(property_name, property_value)*. This method must be called after calling `beginCredential()` and before calling `endCredential()`. As an alternative to calling this method, you can also call `AddCredentialProperty()`.
Signature

```java
addCredentialPropertiesFromMap(arg0:Map) -> void
```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>Map</td>
<td>A map that supplies the name of the credential property and its value.</td>
</tr>
</tbody>
</table>

Examples

The following code listing illustrates adding a credential called "mycredential" to the current context, using the `addCredentialPropertiesFromMap` method.

```java
//Create a MapForce Server object
objMFS.beginCredential("mycredential");
java.util.Map<String, String> credentialMap = new java.util.HashMap<String,String>();
credentialMap.put("username", "altova");
credentialMap.put("password", "b45ax78!");
objMFS.addCredentialPropertiesFromMap(credentialMap);
objMFS.endCredential();
```

5.6.1.1.1.2  `addCredentialProperty`

Adds a property to the current credential (for example, the username, the password, or both). The first argument specifies the property name, and the second argument specifies the property value. Valid property names: `username`, `password`. In MapForce Server Advanced Edition, the property name `oauth:token` is additionally supported.

This method must be called after calling `beginCredential()` and before calling `endCredential()`. As an alternative to calling this method, you can also call `addCredentialProperty()`.

Signature

```java
addCredentialProperty(arg0:String, arg1:String) -> void
```
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>The name of the credential property (for example, &quot;username&quot; or &quot;password&quot;).</td>
</tr>
<tr>
<td>arg1</td>
<td>String</td>
<td>The value of the credential property.</td>
</tr>
</tbody>
</table>

### Examples

The following code listing illustrates how to declare a credential called "mycredential". The credential name must be the one given to the credential in MapForce at design time.

```java
//Create a MapForce Server object

objMFS.beginCredential("mycredential");
objMFS.addCredentialProperty("username", "altova");
objMFS.addCredentialProperty("password", "b45ax78!");
objMFS.endCredential();
```

### 5.6.1.1.1.3 addParameter

Assigns a value to a parameter defined in the mapping.

#### Signature

```java
addParameter(arg0: String, arg1: String) -> void
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>Specifies the parameter name.</td>
</tr>
<tr>
<td>arg1</td>
<td>String</td>
<td>Specifies the parameter value.</td>
</tr>
</tbody>
</table>

### 5.6.1.1.1.4 beginCredential

Creates a new credential with the name supplied as argument. If you call this method, you must also add properties to it using addCredentialProperty() or addCredentialPropertiesFromMap(), and finally close the credential by calling endCredential().
5.6.1.1.1.5 **clearCredentialList**

Clears the list of credentials set previously. All credentials are valid for the lifetime of the object. Call this method if you need to explicitly clear all of the previously set credentials.

**Signature**

```
beginCredential(arg0: String) -> void
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>The name of the credential as it was defined in MapForce.</td>
</tr>
</tbody>
</table>

5.6.1.1.1.6 **clearOptions**

Clears the list of options previously set through the `setOption()` method. All options set through the `setOption` method are valid for the lifetime of the object. Call this method if you need to explicitly clear all of the previously set options.

**Signature**

```
clearOptions() -> void
```

5.6.1.1.1.7 **clearParameterList**

Clears the list of parameters that were previously set using the `addParameter` method.

**Signature**

```
clearParameterList() -> void
```
5.6.1.1.1.8  endCredential

Closes a credential object that was previously created using the beginCredential method.

Signature

```
endCredential() -> void
```

5.6.1.1.1.9  getAPIMajorVersion

Gets the major version of the MapForce Server API. This can be different from the product version if the API is connected to another server.

Signature

```
getAPIMajorVersion() -> int
```

5.6.1.1.1.10  getAPIMinorVersion

Gets the minor version of the MapForce Server API. This can be different from the product version if the API is connected to another server.

Signature

```
getAPIMinorVersion() -> int
```

5.6.1.1.1.11  getAPIServicePackVersion

Gets the service pack version of the MapForce Server API. This can be different from the product version if the API is connected to another server.

Signature

```
getAPIServicePackVersion() -> int
```

5.6.1.1.1.12  getLastExecutionMessage

Gets the message received during the last run command.

Signature

```
getLastExecutionMessage() -> java.lang.String
```
5.6.1.1.1.13  getMajorVersion

Gets the major version of the product, as number of years starting from 1998 (for example, "20" for Altova MapForce Server 2018).

Signature

getMajorVersion() -> int

5.6.1.1.1.14  getMinorVersion

Gets the minor version of the product (for example, "2" for Altova MapForce Server 2018 r2).

Signature

getMinorVersion() -> int

5.6.1.1.1.15  getOutputParameter

Gets the string output generated by the last run command. Returns null if no output was generated. This function requires a string parameter which identifies the name of the output component in MapForce.

Signature

getOutputParameter(arg0: String) -> java.lang.String

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>Specifies the name of the output component as it appears in MapForce. This name is displayed in the title bar of each component on the mapping (or when you right-click the component header, and select Properties).</td>
</tr>
</tbody>
</table>

5.6.1.1.1.16  getProductName

Gets the name of the product (for example, "Altova MapForce Server").
5.6.1.1.1.17  getProductNameAndVersion

Gets the complete name and version of the product (for example, "Altova MapForce Server 2018 r2 sp1 (x64)").

Signature

```
getProductNameAndVersion() -> java.lang.String
```

5.6.1.1.1.18  getServicePackVersion

Gets the service pack version of the product (for example, "1" for Altova MapForce Server 2018 r2 sp1 (x64)).

Signature

```
getServicePackVersion() -> int
```

5.6.1.1.1.19  is64bit

Returns true if the MapForce Server engine is a 64-bit executable.

Signature

```
is64bit() -> boolean
```

5.6.1.1.1.20  run

Executes a MapForce Server Execution file (.mfx file). Returns true in case of success; false otherwise.

Signature

```
run(arg0: String) -> boolean
```
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>Specifies the path to the MapForce Server Execution file (.mfx file). If you specify a relative path, then it will be resolved against the working directory. You can set the working directory by calling the setWorkingDirectory method.</td>
</tr>
</tbody>
</table>

5.6.1.1.1.21 setOption

Sets an option before running the mapping. The first argument specifies the name of the option, while the second argument specifies the option value. This method is particularly useful when a mapping was designed to consume Global Resources (see Altova Global Resources). The currently supported options are as follows:

- **globalresourcefile (or gr)** - A Global Resource file path. (When this option is specified, then a Global Resource configuration name must also be specified, see next item).
- **globalresourceconfig (or gc)** - A Global Resource configuration name. (When this option is specified, then a Global Resource file path must also be specified, see previous item).
- **catalog** - The path to a custom `RootCatalog.xml` file. This option enables you to specify a custom catalog file used to resolve URLs used by the mapping. The default catalog is in the etc subdirectory of the program installation directory.
- **taxonomy-package** - The path to a custom XBRL taxonomy package, if one is required by the mapping.
- **taxonomy-packages-config-file** - The path to a custom XBRL taxonomy package configuration, if one is required by the mapping.

All set options are valid for the lifetime of the object. If you set an option with the same name twice, the previous option will be overridden. To explicitly clear all options, call the `clearOptions()` method.

Signature

```
setOption(arg0: String, arg1: String) -> void
```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>Specifies the name of the option to set.</td>
</tr>
<tr>
<td>arg1</td>
<td>String</td>
<td>Specifies the value of the option to set.</td>
</tr>
</tbody>
</table>
5.6.1.1.1.22 setServerPath
Sets the path of the MapForce Server executable.

Signature
```
setServerPath(arg0: String) -> void
```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>Specifies the path to the MapForce Server executable.</td>
</tr>
</tbody>
</table>

5.6.1.1.1.23 setWorkingDirectory
Sets the current directory for running jobs (relative paths will be evaluated against the working directory).

Signature
```
setWorkingDirectory(arg0: String) -> void
```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg0</td>
<td>String</td>
<td>Specifies the path to the working directory.</td>
</tr>
</tbody>
</table>

5.6.1.2 MapForceServerException
The MapForceServerException class provides programmatic access to exceptions thrown by the MapForceServer class.

```
public class MapForceServerException extends Exception
```
Digital Certificate Management

Digital certificate management is an integral part of secure data exchange between a client computer and a Web server. Since mappings can be executed not only on Windows by MapForce, but also on a Windows, Linux or macOS server by MapForce Server (either standalone or in FlowForce Server execution), this section deals with managing HTTPS certificates on various platforms.

In the context of secure HyperText Transport Protocol (HTTPS), it is important to distinguish between server and client certificates.

Server certificates
A server certificate is what identifies a server as a trusted entity to a client application such as MapForce. The server certificate may be digitally signed by a commercial Certificate Authority, or it may be self-signed by your organization. In either case, while designing the mapping in MapForce, you can specify the following settings:

- Whether the server certificate must be checked.
- Whether the request must proceed if a mismatch has been detected between the name certificate and the name of the host.

These settings are available on the HTTP Security Settings dialog box of MapForce. When you enable server certificate checks, consider the following:

- If you are calling a Web server whose certificate is signed by a trusted Certificate Authority, your operating system will likely be already configured to trust the server certificate, and no additional configuration is necessary.
- If you are calling a Web server which provides a self-signed certificate (for example, a local network server within your organization), you will need to configure your operating system as well to trust that certificate.

In most cases, you can check the level of trust between your operating system and the Web server by typing the URL of the Web service in the browser's address bar. If the server is not trusted, or if your operating system is not configured to trust the server, your browser will display a message such as "This connection is untrusted", or "There is a problem with this website's certificate". Note that you cannot use the browser to check the level of trust with a Web server if the browser uses a certificate database other than that of the operating system (for example, Firefox on Ubuntu).

On Windows, you can establish trust with the server by following the browser's instructions and importing or installing the required certificates into your system's Trusted Root Authorities store (see Trusting Server Certificates on Windows). On macOS, you can do the equivalent operation in Keychain Access (see Trusting Server Certificates on macOS). For instructions applicable to Linux, see Trusting Server Certificates on Linux.

Client certificates
While server certificates are used to identify a server as a trusted entity, client certificates are primarily used to authenticate the caller against the Web server. If you intend to call a Web server which requires client certificates, you may need to contact the administrator of the Web server for the client configuration instructions. Taking IIS (Internet Information Services) as an example, the Web server may be configured to handle HTTPS and client certificates in one of the following ways:
- Require HTTPS and ignore client certificate
- Require HTTPS and accept client certificate
- Require HTTPS and require client certificate

The success or failure of the Web service request depends both on the configuration of the Web server and the client application. For example, if the Web server is configured to require a client certificate, then, for the call to be successful, the calling application must present a valid client certificate.

From a MapForce perspective, the same is true for mappings which include Web service calls through HTTPS. In particular, to run such mappings successfully, it is assumed that the Web server has been configured to accept or require the client certificate, and that the operating system where the mapping runs provides the correct client certificate to the Web server.

The diagram below illustrates a scenario where a client certificate used in MapForce is transferred to a Linux server running MapForce Server. Once the certificate has been transferred to the target operating system, MapForce Server can use it to authenticate itself against the Web server and execute the mapping successfully.

*Deploying mappings with client certificates to another computer*

For HTTPS authentication in Web service calls, MapForce is capable of using Transport Layer Security (TLS) on top of HTTP, which is the successor of Secure Sockets Layer (SSL) protocol. Note that fallback to SSL may occur if either the client implementation or the server does not support TLS.

To support Web calls with client certificate authentication on multiple platforms, MapForce (and MapForce Server) relies on the certificate management implementation of each platform, thus ensuring that certificate management is always in the scope of the underlying operating system. Each operating system provides different support for certificate management, as shown in the table below.
Digital Certificate Management

<table>
<thead>
<tr>
<th>Platform</th>
<th>Certificate management and implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>On Windows, you can manage certificates using the Certificate snap-in (see <a href="#">Accessing the Certificate Stores on Windows</a>). TLS support is available through the Secure Channel (also known as SChannel) library.</td>
</tr>
<tr>
<td>Linux</td>
<td>On Linux, you can manage certificates using the OpenSSL (openssl) command line tool and library. If OpenSSL support is not already available on the Linux machine where MapForce Server is installed, you will need to download and install it before you can manage certificates. TLS support is available through the OpenSSL library (<a href="https://www.openssl.org/">https://www.openssl.org/</a>).</td>
</tr>
<tr>
<td>macOS</td>
<td>On macOS, you can manage certificates using the Keychain Access Manager, located under Finder &gt; Applications &gt; Utilities. TLS support is provided by the Secure Transport library native to the operating system.</td>
</tr>
</tbody>
</table>

If you execute the mapping on a Windows operating system where you can already successfully consume the same Web service that you intend to call from MapForce, no additional certificate configuration is normally required (for the conditions to run the mapping successfully on Windows, see [Client Certificates on Windows](#)). However, if you design mappings with MapForce on a Windows computer, and then deploy them to another computer (which may run a different operating system), the client certificate is not stored or copied together with the deployed package. For the Web service call (and the mapping) to execute successfully, the client certificate must exist on the target operating system as well.

To transfer a certificate from a Windows system to another Windows-based computer, export the required certificate (with private key) from the source system (see [Exporting Certificates from Windows](#)). Then import the same certificate to the Current User\Personal store on the target operation system (see [Client Certificates on Windows](#)).

For instructions on how to transfer client certificates to the Linux and macOS platforms, see [Client Certificates on Linux](#) and [Client Certificates on macOS](#), respectively.
6.1 Trusting Server Certificates on Linux

On Linux, you can import a trusted certificate into the system's certificate store as shown below.

Perform the following steps only if you are sure of the authenticity of the certificate you want to trust.

On Debian and Ubuntu, follow the steps below:

1. Copy the certificate file of the Web server to the following directory.
   
   ```
   sudo cp /home/downloads/server_cert.crt /usr/local/share/ca-certificates/
   ```

2. Update the certificate store as follows:

   ```
   sudo update-ca-certificates
   ```

On CentOS, follow the steps below:

1. Install the `ca-certificates` package:

   ```
   yum install ca-certificates
   ```

2. Enable the dynamic certificate authority configuration feature:

   ```
   update-ca-trust enable
   ```

3. Copy the server certificate to the following directory:

   ```
   cp server_cert.crt /etc/pki/ca-trust/source/anchors/
   ```

4. Use the command:

   ```
   update-ca-trust extract
   ```

For cases where you need to access the server only through the browser, it is sufficient to import the certificate into the browser certificate store. The exact instructions will vary for each browser. For example, in Firefox 59.0.2, you can do this as follows:

1. Under Options | Privacy & Security, click View Certificates.
2. On Authorities tab, click Import and browse for the root certificate file created previously.
3. When prompted, select Trust this CA to identify websites.
You have been asked to trust a new Certificate Authority (CA).

Do you want to trust "ODIN CA" for the following purposes?

- [x] Trust this CA to identify websites.
- [ ] Trust this CA to identify email users.
- [ ] Trust this CA to identify software developers.

Before trusting this CA for any purpose, you should examine its certificate and its policy and procedures (if available).

View Examine CA certificate
6.2 Trusting Server Certificates on macOS

On macOS, you can import a trusted certificate into Keychain Access as follows.

1. Run Keychain Access.
2. Click System, and then click Certificates.
3. On the File menu, click Import Items.
4. Browse for the trusted certificate, and click Open.
5. Enter the Keychain Access password when prompted, and then click Modify Keychain.
6. Double-click the certificate, expand the Trust section, and select Always Trust.
### 6.3 Trusting Server Certificates on Windows

On Windows, you can import a trusted certificate into the system certificates store as follows:

1. Open the Windows certificate store for the computer account, see Accessing Windows Certificate Store.

   Perform the following steps only if you are sure of the authenticity of the Web server certificate.

2. Under "Trusted Root Certification Authorities", right-click Certificates, and select All Tasks | Import, and follow the certificate import wizard.

6.4 Accessing the Certificate Stores on Windows

On Windows, you can manage certificates from the Microsoft Management Console (MMC) snap-in, either for your user account, or for the computer account.

To open the Certificates snap-in (for the current Windows user):

- Run `certmgr.msc` at the command line.

To open the Certificates snap-in (for the computer account):

1. Run `mmc` at the command line.
2. On the **File** menu, click **Add/Remove Snap-in**.
3. Click **Certificates**, and then click **Add**.
4. Click **Computer account**, and click **Next**.
5. Click **Local computer**, and then click **Finish**.
6.5 Exporting Certificates from Windows

For mappings that call Web services through HTTPS and are deployed to a macOS or Linux server running MapForce Server or FlowForce Server, the same client certificate must be available on the non-Windows operating system as the one used on Windows to design and test the mapping. To execute such mappings on a non-Windows operating system with MapForce Server, export the required certificate with private key from Windows and then import it into the target operating system.

To export a certificate with private key from Windows:

1. On Windows, open the Certificates snap-in (see Accessing the Certificate Stores on Windows).
2. Right-click the certificate that you want to export, point to All Tasks, and then click Export.
3. Click Next.

4. Choose to export from Windows the certificate together with its private key, and then click Next.
5. Choose the **Personal Information Exchange - PKCS #12 (.pfx)** file format, and then click **Next**.
Note: Make sure not to select the option **Delete the private key if the export is successful**, otherwise you will not be able to make use of the certificate after it is exported.

6. Enter a password, and then click **Next**. You will need this password after you copy the certificate to the target operating system.
7. Browse for the location of the file to export, and then click **Next**.
8. Click **Finish**.
Completing the Certificate Export Wizard

You have successfully completed the Certificate Export wizard.

You have specified the following settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Setting Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>C: \UserService</td>
</tr>
<tr>
<td>Export Keys</td>
<td>Yes</td>
</tr>
<tr>
<td>Include all certificates in the certification path</td>
<td>Yes</td>
</tr>
<tr>
<td>File Format</td>
<td>Personal</td>
</tr>
</tbody>
</table>

Finish
6.6 Client Certificates on Linux

If your mappings include Web service authentication through HTTPS by means of client certificates, follow these steps to deploy such mappings to a Linux machine running MapForce Server:

1. Open in MapForce the mapping which calls the Web service.
2. Double-click the header of the Web Service component. The Component Settings dialog box appears.
3. Click Edit next to HTTP Security Settings.
4. In the HTTP Security Settings dialog box, click Client Certificate, and then select the required certificate from the Current User:Personal store on Windows.
5. Save the mapping and compile it to a mapping execution file or deploy it to FlowForce Server.
6. Transfer the client certificate required by the Web service call to the target operating system. Make sure that the certificate has a private key, and that the Enhanced Key Usage property of the certificate includes "Client authentication" as purpose.

To transfer the client certificate to Linux:

1. Export the client certificate with private key from Windows, in the Personal Information Exchange - PKCS #12 (.pfx) file format (see Exporting Certificates from Windows (18)).
2. Copy the certificate file to the Linux machine.
3. Convert the .pfx file to .pem format using the command:
   
   ```
   openssl pkcs12 -in cert.pfx -out "John Doe.pem" -nodes
   ```
   
   This command parses the .pfx file and outputs a .pem file, without encrypting the private key. Certificates with an encrypted private key prompt for password and are not supported in server execution.

Executing the mapping

To instruct MapForce Server to use the .pem file as client certificate, set the --certificatespath parameter when running the mapping. The --certificatespath parameter defines the path of the directory where all certificates required by the current mapping are stored. For example, if the certificate file path is /home/John/John Doe.pem, then --certificatespath must be set to /home/John.

By default, if the --certificatespath parameter is not provided, MapForce Server looks for certificates in the directory $HOME/.config/altova/certificates of the current user.

For the mapping to execute successfully, the certificate file is expected to have the .pem extension and the file name must match the Common Name (CN) of the certificate, including spaces (for example, John Doe.pem). If the CN contains a forward slash (/), it must be replaced with an underscore (_ ) character.

If you intend to execute the mapping as a FlowForce Server job, copy the certificate file to the $HOME/.config/altova/certificates directory. When running the job, FlowForce Server will use this directory to look for any certificate files required by the mapping.

For security considerations, make sure that certificate files are not readable by other users, since they...
contain sensitive information.
6.7 Client Certificates on macOS

If your mappings include Web service authentication through HTTPS client certificates, follow these steps to deploy such mappings to a macOS running MapForce Server:

1. Open in MapForce the mapping which calls the Web service.
2. Double-click the header of the Web Service component. The Component Settings dialog box appears.
3. Click **Edit** next to HTTP Security Settings.
4. In the HTTP Security Settings dialog box, click **Client Certificate**, and then select the required certificate.
5. If the certificate name does not match exactly the host name of the server, select **Allow name mismatch between certificate and request**.
6. Save and deploy the mapping to the target operating system.
7. Transfer the client certificate required by the Web service call to the target operating system. Make sure that the certificate has a private key, and that the **Enhanced Key Usage** property of the certificate includes "Client authentication" as purpose.

**To transfer the client certificate to macOS:**

1. Export the client certificate with private key from Windows, in the **Personal Information Exchange - PKCS #12 (.pfx)** file format (see Exporting Certificates from Windows) and copy the .pfx file to the macOS.
2. If this hasn't been done already, make sure that the operating system trusts the server certificate (see Trusting Server Certificates on Mac OS).
3. Run Keychain Access from **Finder > Applications > Utilities**.
4. On the **File** menu, click **Import Items**.
5. Browse for the the client certificate exported from Windows in step 1 and select a destination keychain.
6. Click **Open** and enter the password with which the certificate was encrypted.

**Executing the mapping**

You are now ready to run the mapping using the MapForce Server run command. Note the following:

- If you execute the mapping remotely through SSH, first unlock the keychain with the **security unlock-keychain** command.
- If you execute the mapping through the macOS graphical user interface, when prompted to allow MapForce Server access to the keychain, click **Allow**.
mapforceserver wants to sign using key "privateKey" in your keychain.
The authenticity of "mapforceserver" cannot be verified. Do you want to allow access to this item?

Always Allow  Deny  Allow
6.8 Client Certificates on Windows

When you run on Windows a mapping which requires client certificates, the conditions to run the mapping successfully are as follows:

- The client certificate must exist in the **Current User\Personal** certificate store (also referred to as the **My** store). For the certificate to exist in this store, it must be imported through the Certificate Import Wizard. For instructions, see https://technet.microsoft.com/en-us/library/cc754489(v=ws.11).aspx.
- The certificate must have a private key.
- The **Enhanced Key Usage** property of the certificate must include "Client authentication" as purpose.

In the current version of MapForce, due to a limitation of the library used by MapForce, Windows will select the required certificate automatically from the certificate store when you run the mapping. The mapping will execute successfully if, after filtering the **Current User\Personal** certificate store, the server finds a suitable certificate. Note that the HTTPS authentication (and the certificate selection operation) is managed by Windows and is not controlled by MapForce or MapForce Server. In some cases, if multiple certificates exist in the **Current User\Personal** store, an unsuitable certificate may be selected automatically by the operating system, which causes the mapping execution to fail. This situation can be avoided by limiting the number of certificates.
available in the **Current User\Personal** store.
