1 Introduction

Altova Solvency II XBRL add-in for Excel is targeted at businesses and organizations that submit Solvency II data in XBRL format as part of the Solvency II regulatory framework for insurance companies.

Altova Solvency II XBRL add-in for Excel enables stakeholders in the Solvency II process to do the following:

- Enter Solvency II data in Microsoft Excel using a predefined template spreadsheet which maps to the Solvency II XBRL taxonomy.
- Validate report data directly from Excel to ensure it conforms to the Solvency II XBRL taxonomy.
- Export Solvency II reports from Excel to XBRL format.
- Import data from existing Solvency II XBRL reports into Excel.
- Batch convert XBRL files to Excel (.xlsx) format.

The add-in supports the following Solvency II taxonomies:

- EIOPA - Supervisory Solvency II reporting (version 2.0.1 up to the most recent version)
- EIOPA - Supervisory reporting for Pension Funds (version 2.30 up to the most recent version)

In addition, the following country-specific taxonomies are supported:

- Bank of England (BOE) Insurance Taxonomy
- Central Bank of Ireland (CBI) Solvency II NST
- De Nederlandsche Bank Financieel Toetsingskader (DNB FTK)
- National Bank of Belgium (NBB) IRI
Notes:

- The list of supported XBRL taxonomies is regularly updated to include newer versions, independently of Altova add-in releases. To view or install the latest XBRL taxonomy versions, use the XBRL Taxonomy Manager tool included with the add-in.
- The country-specific XBRL taxonomies as well as the older Solvency II taxonomy versions are not installed by default when you install the add-in. You can view, install, upgrade, or uninstall such taxonomies on demand from the XBRL Taxonomy Manager.

*Last updated: 18 May 2021*
1.1 System Requirements

To install and run the add-in, note the following system requirements:

- Windows 7 SP1 with Platform Update, Windows 8, Windows 10, Windows Server 2008 R2 SP1 with Platform Update or newer
- .NET Framework 4.0 or later

Also note the following important points:

- The add-in is available for both Microsoft Excel 32-bit and 64-bit. Because of memory requirements, some entry points cannot be loaded in the 32-bit version of the add-in, in which case they are disabled. To load such entry points, use Excel 64-bit and install the 64-bit version of the add-in.
- The add-in requires full access to the Excel document in order to create, validate, and export XBRL reports. If your organization enforces Information Rights Management (IRM) using the Azure Information Protection or a similar technology, the latter may restrict access to the Excel document and thus prevent the add-in from working. For information about how to allow code to run behind documents with restricted permissions, see https://docs.microsoft.com/en-us/visualstudio/vsto/how-to-permit-code-to-run-behind-documents-with-restricted-permissions?view=vs-2019.
1.2 Installation and Licensing

To install the Altova Solvency II XBRL add-in for Excel, download the executable from the Altova Download Center (https://www.altova.com/download) and run it. Follow the wizard steps to complete the installation. You will need to accept the license agreement and privacy policy in order to proceed with the installation.

Make sure to download the executable corresponding to your operating system and Excel platform (32-bit or 64-bit). The 32-bit executable can be installed on both 32-bit and 64-bit Windows. However, it supports only Excel 32-bit. Note that if you have Excel 32-bit and install the 64-bit version of the add-in, you will still be running the 32-bit version.

After the installation, a new tab called Solvency II becomes available in the Excel ribbon.

Licensing

To use Altova Solvency II XBRL add-in for Excel, you need a valid license key code. To purchase a new key code or request a free evaluation from the Altova website, take the following steps:

1. In the Excel ribbon, click the Solvency II tab.
2. Click Add-In Activation.

A dialog box appears with instructions on getting a new license from Altova or managing an existing license.

After you purchase a license from Altova, follow the same steps as above to open the activation dialog box and upload the license file.

Alternatively, you can upload purchased licenses to an Altova LicenseServer running on your organization's network. Altova LicenseServer is a free product that helps organizations manage all Altova licenses in a centralized place. For more information about LicenseServer, see https://www.altova.com/licenseserver.

See also License Information.

How to view the current version of the add-in

1. In the Excel ribbon, click the Solvency II tab.
2. Click About Solvency II Add-In.
1.3 Installing XBRL Taxonomies

When you install the add-in for the first time on your computer, only the most recent version of the Solvency II XBRL taxonomies is installed by default.

If you need support for other XBRL Taxonomy versions or country-specific XBRL taxonomies, these have to be installed separately. Specifically, you can install, upgrade, or uninstall XBRL taxonomies on demand, using the XBRL Taxonomy Manager tool included with the add-in.

To run the XBRL Taxonomy Manager, do one of the following:

- In the Solvency II ribbon, click Manage Taxonomies.
- Run (double-click) a file with .altova_taxonomies extension downloaded from the Altova website. To open the XBRL Taxonomy Download Center in your browser, select the Solvency II ribbon, and then click Altova on the Web > Taxonomy Download.
- From the Windows Control Panel, right-click the Altova Taxonomy Manager entry and select Change or Uninstall from the context menu.

In addition, the check box Invoke Altova Taxonomy Manager is available on the last page of the installation wizard, after you complete the installation of Altova Solvency II XBRL add-in for Excel.

Note the following:

- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect for all users accounts on the same computer.
- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect in all Altova XBRL-enabled applications installed on the same computer.
- If the current taxonomy has dependencies on other taxonomies, the dependent taxonomies are also installed (or uninstalled, as applicable).

For further information, see Managing XBRL Taxonomies.
2 Creating a New Report

The instructions below show you how to prepare a new XBRL report based on the Solvency II XBRL taxonomy available in Altova Solvency II XBRL add-in for Excel. This XBRL taxonomy is installed by default on your computer when you install the add-in. Additional taxonomies can be installed separately. For details, see Installing XBRL Taxonomies.

To create a new report:
1. In the Excel ribbon, click the Solvency II tab.
2. Click Insert New Report.
3. Select the taxonomy entry point corresponding to the report that you want to create. Use the filter at the top of the dialog box to filter entry points by keywords. Note that by default only the most current entry points for the current version of the add-in are shown. To show all the XBRL taxonomies available for download, select the Show entry points available for download check box. To show all versions, clear the Show only most current entry points check box.

Entry points that are shown in brick red color are not installed. To install the respective XBRL taxonomies, select the entry point and click OK. This opens the XBRL Taxonomy Manager, where you can complete the installation. For more information, see Managing XBRL Taxonomies.

Because of memory requirements, some entry points cannot be loaded in the 32-bit version of the add-
in, in which case they appear as grayed out in the dialog box above. To make loading of such entry points possible, use Excel 64-bit and install the 64-bit version of the add-in.

4. Wait while the report tables are loaded into Excel. During this operation, a dialog box informs you of the progress, for example:

![Inserting new report...](image)

Once the report tables have finished loading, notice the Tables section in the Solvency II Report Pane.
5. Select the check boxes next to tables that you want to include in the report. Notice that each included table appears on a new sheet in the Excel book.

You can now start entering data in tables, validate it, and export it to XBRL format. See the following topics for more information:

- **Entering Data**
- **Controlling Accuracy of Cells**
- **Validating Data**
- **Exporting Data to XBRL**

**Solvency II Report Pane**

The **Solvency II Report Pane** is the area where you can include or exclude tables from the report, view information about each cell, and view or set various report properties. By default, this pane is visible. You can show or hide it by clicking the **Toggle Solvency II Report Pane** command in the ribbon. As illustrated above, the **Solvency II Report Pane** has two main sections: **Properties** and **Tables**.

**Properties**

The properties displayed in the **Solvency II Report Pane** directly affect the content of the XBRL instance file that will be created when you export the XBRL instance. To view what each property does, click it and observe the description displayed in the gray box under the grid. Properties that are grayed out are read-only.
Otherwise, you can edit a property by typing text or selecting a value as applicable.

The **Scheme** and **Identifier** properties under "Reporting Entity" are typically provided by the relevant competent authorities.

Also note that, even though some property values begin with "http" (for example, **Entry Point URI, Scheme**), they do not necessarily point to live web resources and thus should not be considered dead links. To resolve entry point URIs, the add-in uses a catalog mechanism that maps URIs to files on the local system. This is largely due to the size of the taxonomies and the fact that they contain thousands of files. Accessing the taxonomy files on the Internet would result in extremely slow performance, even if their issuing organizations served them that way.

Properties are grouped into the following three tabs:

- The **Report** tab displays properties applicable to the entire report (one report corresponds to one Excel workbook).
- The **Table** tab displays only properties of the currently selected table. A table normally corresponds to a single Excel worksheet. Therefore, whenever you click inside a new Excel sheet, the properties are re-drawn to reflect the new worksheet.
- The **Cell** tab displays only properties of the currently selected cell. Whenever you click a new cell, the cell properties are re-drawn accordingly.

You can set the accuracy-related properties at report, table, or cell level. For more information, see **Controlling Accuracy of Cells**.

### Tables

To include a table in the report, select its corresponding check box in the **Solvency II Report Pane**. Each included table appears on a new sheet in the Excel book. To go to a specific sheet, navigate to it using the standard Excel way or click the corresponding table in the **Solvency II Report Pane**. To remove a particular table from the report, clear the check box next to it. Tables that are not selected will not be included in the report.

Some tables support a z-axis (a third dimension). For information about adding a z-axis to a table, see **Entering Data into Three-Dimensional Tables (Z-Axis)**.

Each report table displayed in the **Solvency II Report Pane** is XBRL-bound, which means that data you enter directly in the table cells will be reflected in the XBRL instance file when the report is ready. For more information, see **Exporting Data to XBRL**. While the report data is work in progress, you can save the Excel workbook and reopen it at any time later just like a standard Excel workbook.

Any sheets that contain tables are bound to the XBRL taxonomy, so they must not be deleted. It is not recommended to rename such sheets. If necessary, you can add new sheets to the workbook. However, such sheets will not be bound to the XBRL taxonomy. As a result, these sheets will be ignored when you generate the XBRL instance file.
2.1 Entering Data

You can fill a report with data either by entering data into cells manually or by pasting values. With some cells, you can select a value from a predefined list, such as countries or currencies. In some report tables, you may need to add new rows or columns. Below you will find information about how to enter data.

Editable versus non-editable cells
As a general rule, gray cells must not be edited. Only cells that are included in the XBRL-bound area (delimited by the table boundaries) are to be edited. For guidance, with respect to the purpose of the cell and data to be entered, consult the cell information (properties) displayed in the Solvency II Report Pane in the Cell tab.

Pasting data
If you paste data from multiple columns, the number of pasted columns should correspond to the number of columns in the predefined sheet. If you accidentally paste a larger number of columns or type text outside the default table, unwanted columns may appear outside the XBRL-bound area. To delete unwanted columns, right-click the cell and select Delete > Table Columns. To prevent Excel from adding new columns and rows automatically, go to File > Options > Proofing > AutoCorrect Options > AutoFormat As You Type > Apply as you work and click to clear the Include new rows and columns in table check box.

When you paste data, it is recommended to keep only the values (and not the formatting). Namely, select the Paste Values option when pasting cells or rows.

Actual versus displayed cell value
While generating the XBRL instance file, the add-in ignores any cell formatting information and exports the actual value of the Excel cell. However, bear in mind that the actual value may be different from the value displayed in the cell because of the cell formatting information. You can see the actual value (the one that will be written to the XBRL instance) in the formula bar of Excel. Consider this example:

In the example above, the value that will be written to the XBRL instance is 12345. Note that the number accuracy reported in the XBRL instance file also depends on the value you selected for the "Accuracy" properties (see Controlling Accuracy of Cells).

Enumeration values
Some cells expect a fixed predetermined value (e.g., cells that represent currencies or countries). In this case, the add-in displays a small tooltip when you click the cell. You can pick up the required value from the drop-
To view the full list of all possible values, click the cell and see the cell properties in the **Cell** tab of the **Solvency II Report Pane**.

**Conditional cells**

In some tables, you must first fill out a cell value in order to make other cells of the table editable. For example, in the table below, cells A5 and B5 must be filled out before all the other cells in the same row can be edited:

<table>
<thead>
<tr>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
<th>F</th>
</tr>
</thead>
<tbody>
<tr>
<td>E.01.01.16.01</td>
<td>Deposits</td>
<td>to cedants</td>
<td>- line-by-line reporting</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3 Line</td>
<td>identification</td>
<td>code</td>
<td>Issuer country</td>
<td>Currency</td>
<td>Total Solvency II amount</td>
</tr>
<tr>
<td>4 EC0010</td>
<td>EC0020</td>
<td>EC0030</td>
<td>EC0040</td>
<td>EC0050</td>
<td>EC0060</td>
</tr>
<tr>
<td><strong>Enter Line identification code:</strong></td>
<td>Please enter the Line identification code for this row.</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
## Cells with multiple values

Depending on the XBRL taxonomy, some reports might have facts that represent an arbitrary list of comma-separated multiple values. As a result, the corresponding cell also requires multiple values to be entered in the same cell. For example, table S.25.0.1.21.0.3 available through the entry point 21 - Annual Solvency II public disclosure Solo contains cells that take multiple values.

To enter data for such cells, expand the drop-down list and click all the relevant items.
Alternatively, you can type all the numeric values, separated by a comma, as shown below. Remember that you can view all possible values of a cell in the **Cell** tab of the **Solvency II ReportPane**.

After you exit the cell with multiple values, it is automatically re-drawn to display all selected values in a readable form (even though you may have entered only numbers).

### Adding new rows

With some tables, you may need to create new rows. For example, this is the case for table S 01.03.01.01 available through the entry point **Solvency II 2.3 - Annual Solvency II Reporting Solo**. You can add new rows using the standard Excel commands or shortcuts. Alternatively, you can click the **Add Row** button in the ribbon. For example, to add a new row to table C 10.02 of the entry point mentioned above, do one of the following:

- In the Excel ribbon, click the **Solvency II** tab. Then click **Add Row** | **Insert Row Below**. Note that the commands to insert or delete rows are enabled only if the table supports adding new rows.
- Click the rightmost cell of the last row in the table and press **Tab**.
- Right-click a cell in the empty row and select **Insert** | **Table Row Below** from the context menu.
Note: Any newly added rows must be within the XBRL-bound area of the table, clearly delimited by black lines.

Adding new columns
For some tables, you may need to add extra columns. In other words, they can grow horizontally. For example, this is the case for table S.04.01.01.03 available through the entry point Solvency II 2.3 - Annual Solvency II Reporting Solo. You can add new columns to such tables in one of the following ways:

- In the Excel ribbon, click the Solvency II tab. Then click Add Column. Note that this command is enabled only if the table supports adding new columns according to the XBRL taxonomy.
- Click the Add button that appears next to the rightmost column of a table.

- Right-click a table cell and select Insert | Table Columns to the Right from the context menu.
2.2 Entering Data into Three-Dimensional Tables (Z-Axis)

Most of the report tables have only two dimensions: the x-axis (columns) and the y-axis (rows). However, there are some tables where you may need to enter data into a third dimension (the z-axis). An example of such a table is the S.16.01.01.01 table available through the entry point Solvency II 2.3 - Annual Solvency II Reporting Solo.

In cases such as the one above, you can add a new sheet along the z-axis (third dimension) of the table as follows:

1. In the Excel ribbon, click the Solvency II tab.
2. Click the Add Sheet (z-Axis) button. Note that the commands to insert or delete new z-axis sheets are enabled only if the table supports adding a z-axis.

Alternatively, right-click the table in the Solvency II Report Pane and select Add New Sheet (z-Axis) from the context menu, for example:
This creates a new sheet that displays the third dimension of the table (z-axis). The sheet representing the z-axis always has an indicative name that resembles the original table. In this example, if you select "Euro" as currency, the new sheet is called "F 34.00c (EUR)".

Data from the third dimension (z-axis) of a table is displayed as new sheets in Excel. Therefore, three-dimensional tables span across more than one sheet. This is an exception to the rule that one Excel sheet corresponds to one table in the XBRL report. In the XBRL instance, data that belongs to the z-axis will be, however, correctly reported as part of the same table.

When you click a cell that represents the z-axis, all the possible values for the drop-down list are displayed in the Cell tab of the Solvency II Report Pane, for example:
Deleting z-Axis sheets

You can delete sheets that contain data from the third dimension (z-axis) in more than one way.

1. Select the required sheet or click the corresponding entry in the Tables section of the **Solvency II Report Pane**.
2. Do one of the following:
   - In the **Solvency II** tab, click **Remove Sheet (z-Axis)**
   - Right-click the table in the **Solvency II Report Pane** and select **Remove Sheet (z-Axis)** from the context menu.
2.3 Controlling Accuracy of Cells

The accuracy of monetary and other numeric values in the XBRL report can be controlled by setting the following report properties:

1. Accuracy of monetary cells
2. Accuracy of numeric cells
3. Accuracy of percentage cells

These properties are available in the Solvency II Report Pane in the Properties group.

The property **Accuracy of Monetary Cells** applies to numeric cells that represent a monetary value.

The property **Accuracy of Numeric Cells** applies to numeric values that have no unit except for percentage values, which have their own data type.

The property **Accuracy of Percentage Cells** applies to values that represent a percentage.

To see the type of a cell, select a cell and click the **Cell** tab in the Solvency II Report Pane and see the **Type** property, for example:
The accuracy you select from the Solvency II Report Pane controls the accuracy that will be written for this fact in the XBRL instance file. More specifically, the Accuracy properties are bound to the decimals attribute in the XBRL instance file. For example, in the image below, the accuracy value indicated in the brackets corresponds to the value of the decimals attribute in the XBRL instance file.
By default, accuracy is set as follows:

- The **Accuracy of Monetary Cells** is set to **Cents (2)**, which sets the value of the `decimals` attribute in the XBRL instance to "2"
- The **Accuracy of Percentage Cells** is set to **Basis Points (4)**, which sets the value of the `decimals` attribute in the XBRL instance to "4".
- The **Accuracy of Numeric Cells** is set to **Exact (INF)**, which sets the value of the `decimals` attribute in the XBRL instance to "INF".

You can set the accuracy-related properties at report, table, or cell level (see the corresponding tabs in the image above). If you set accuracy at multiple levels, keep in mind that the more specific property always overrides the more generic one. For example, the accuracy set at cell level takes priority over the one set at table level. Likewise, the accuracy set at table level takes priority over the one set at report level.

For monetary and numeric cells, the accuracy value can be either positive or negative.

A positive value $N$ specifies the accuracy of up to $N$ digits to the right of the decimal separator. For example, the value 2 specifies the accuracy of monetary cells to be in cents.

A negative value $N$ specifies the accuracy of up to $N$ digits to the left of the decimal separator. For example, the value -3 specifies the accuracy to be up to thousands, while the value -6 specifies the accuracy to be up to millions.
3 Common Tasks

3.1 Validating Data

Validation ensures that the XBRL data you are filing conforms to the XBRL specification. The report data should be validated before you export it to XBRL. You might also want to validate data progressively after each action that could potentially render it invalid (for example, after pasting new rows into the spreadsheet).

To validate data, click the Validate button in the Solvency II tab of the Excel ribbon. To validate XBRL data, the add-in creates a temporary in-memory XBRL instance. When the validation of the in-memory instance completes, a validation report similar to the one below is displayed.

The validation result can be any of the following:

<table>
<thead>
<tr>
<th>Message type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>✔️</td>
<td>The instance data is valid.</td>
</tr>
<tr>
<td>🚩</td>
<td>The instance data is valid but has inconsistencies or warnings.</td>
</tr>
<tr>
<td>🚫</td>
<td>The instance data is not valid.</td>
</tr>
</tbody>
</table>

The Validation Report dialog box may additionally display any of the following message types: information messages, warnings, and errors.

<table>
<thead>
<tr>
<th>Message type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>🚩</td>
<td>Denotes an information message. Information messages do not make the XBRL instance invalid.</td>
</tr>
<tr>
<td>🚩</td>
<td>Denotes a warning message or an inconsistency. Warnings and inconsistencies do not make the XBRL instance invalid.</td>
</tr>
<tr>
<td>🚫</td>
<td>Indicates an error. If there are validation errors, the XBRL instance is not valid. In this case, you will need to edit the report data to correct each error before proceeding with the export to XBRL. Note: During validation, the add-in checks XBRL formula assertions and reports them as errors. If you are using the Altova RaptorXML+XBRL Server for validation (<a href="https://www.altova.com/raptorxml">https://www.altova.com/raptorxml</a>), XBRL formula assertions may be optionally</td>
</tr>
<tr>
<td>Message type</td>
<td>Meaning</td>
</tr>
<tr>
<td>--------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>configured not to be reported as errors.</td>
</tr>
</tbody>
</table>

**Note:** By default, the add-in treats invalid cell values as errors. If necessary, you can configure the add-in to treat invalid cell values as warnings instead. For more information, see Settings.

When the validation fails, the Validation Report window may display links to the cell where the error has occurred. To quickly find a cell with the error, click the underlined text, and the cursor will be positioned automatically on the required cell. Note that there are cases where multiple cells are involved in a single validation check. In such cases, clicking on the error link will select just one of the affected cells.

---

**Validation Report**

- Solvency II report XBRL data was successfully created.
- The XBRL instance data is valid.
- Evaluated 251 additional validation rules: 181 satisfied, 70 unsatisfied.
  - Content of the submission: 69 unsatisfied evaluations
  - Assertion s2md_TV23-1-10-2: 1 unsatisfied evaluations
    - TV23-1-10-2: { (c0010) } no( empty((S.01.01.01.0110)))
  - Assertion s2md_TV23-1-11-2: 1 unsatisfied evaluations
    - TV23-1-11-2: { (c0010) } no( empty((S.01.01.01.0110)))

---

**To copy the contents of the validation report to clipboard:**

- Click **Copy** and paste into a target file (for example, an email). Alternatively, right-click inside the Validation Report window and select **Copy All Messages** from the context menu.

**To save the validation report as text or HTML:**

- Click **Save**. Alternatively, right-click inside the Validation Report window and select **Save Validation Report** from the context menu.

**To clear the validation report:**

- Click **Clear**. Alternatively, right-click inside the Validation Report window and select **Clear** from the context menu.
3.2  Exporting Data to XBRL

Once your report is ready and valid (see Validating Data), you can generate an XBRL instance file. To do this, click the Solvency II tab. Then click Export to XBRL.

By default, instance files are saved as files with an .xbrl extension. If you need the exported file to have another extension (for example, .xml), type the file extension in the Export dialog box.

While the XBRL instance is being created, a dialog box which informs you about the progress may be displayed for a short time. During the export operation, data is automatically validated. Any errors, inconsistencies and warnings are reported on the screen after the export finishes.

Note:  Cell values that are not valid, that is, cells that do not conform to the data type of the underlying XBRL concept, prevent the report from being exported.

For tips on how to avoid data formatting errors, see Entering Data. Note, however, that not all XBRL validation errors might be related to incorrect formatting. Some errors might occur because entered data does not meet the XBRL validation rules applicable to the report you are filing.
3.3 Importing Data

You can import data from existing instances of XBRL reports into Excel (typically, files with an .xbrl extension). For the import to be successful, the imported instances must be valid XBRL reports. They may be either reports you have previously generated using the Altova Solvency II XBRL add-in for Excel or reports that you received from other parties.

To import an existing XBRL instance file into Excel:

1. In the Excel ribbon, click the Solvency II tab.
2. Click Import from XBRL and browse for the XBRL instance file.

Note: If a report is already open in Excel, the Import from XBRL button is disabled. To enable the command, save and close the current report (workbook) and create a new workbook.

During the import operation, a dialog box informs you about the progress:

While the report data is loaded into Excel, it is automatically validated. A dialog box notifies you about potential warnings, inconsistencies, or errors (see also Validating Data).

Validation Report

Note: During the import, the add-in validates XBRL formula assertions. The report will be imported even if it contains unsatisfied assertions.
Managing XBRL Taxonomies

XBRL Taxonomy Manager is a tool that provides a centralized way to install and manage XBRL taxonomies for use across all Altova XBRL-enabled applications, including Altova Solvency II XBRL add-in for Excel. On Windows, XBRL Taxonomy Manager has a graphical user interface and is also available at the command line. On Linux and Mac*, the tool is available at the command line only.

* The Linux and macOS operating systems are applicable only if you are running XBRL Taxonomy Manager on those operating systems in conjunction with Altova cross-platform server applications such as MapForce Server, StyleVision Server, or RaptorXML+XBRL Server.

XBRL Taxonomy Manager provides the following features:

- View XBRL taxonomies installed on your computer, and check whether new versions are available for download.
- Download newer versions of XBRL taxonomies independently of the Altova product release cycle. All taxonomies are maintained by Altova on an online-based storage accessible to XBRL Taxonomy Manager, and you can download them as soon as they become available.
- Install or uninstall any of the multiple versions of a given taxonomy (or all versions if necessary).
- A single XBRL taxonomy represents a "package" but it may have dependencies on other taxonomies. Whenever you choose to install or uninstall a particular taxonomy, any dependent taxonomies are detected and also installed or removed automatically. The graphical user interface (or the command line if applicable) informs you when dependencies are being added or removed.
- XBRL taxonomies maintained through XBRL Taxonomy Manager benefit from the XML catalog mechanism that enables URI references in instance or schema documents to be resolved from local files, as opposed to being retrieved from the Internet. This is extremely important in the case of big XBRL taxonomies where schema resolution from remote URIs is not practical or even recommended, mainly for performance reasons.

XBRL Taxonomy Manager provides a way to administer any of the XBRL taxonomies required for use in any one of the Altova XBRL-enabled applications (see list below). These include the European Banking Authority Reporting Framework taxonomies, US-GAAP Financial Reporting taxonomies, and various other country- or domain- specific XBRL taxonomies. To view the full list, either run XBRL Taxonomy Manager or run the list command at the command line.

Altova XBRL-enabled applications

The following Altova applications are XBRL-enabled and thus benefit from the features provided by XBRL Taxonomy Manager:

- Altova XBRL Add-ins for Excel (EBA, Solvency II)
- MapForce Enterprise Edition
- MapForce Server
- MapForce Server Advanced Edition
- RaptorXML+XBRL Server
- StyleVision Server
- StyleVision Enterprise Edition
- XMLSpy Enterprise Edition
Changes in XBRL taxonomies using XBRL Taxonomy Manager take effect for all the applications listed above if they are installed on the same computer.

Installation

XBRL Taxonomy Manager is installed automatically whenever you install any Altova XBRL-enabled application or the Altova Mission Kit Enterprise Edition. Likewise, it is removed automatically when you uninstall the last Altova XBRL-enabled application from your computer or the Altova Mission Kit Enterprise Edition.

How it works

Altova maintains an online taxonomy storage where all XBRL taxonomies used in Altova products are stored. This taxonomy storage is updated on a periodical basis, for example, shortly after new versions of relevant taxonomies are released by their issuing organizations.

Whenever you run XBRL Taxonomy Manager at the graphical user interface, information about the latest available taxonomies is displayed in a dialog box, where you can view, install, upgrade or uninstall them. You can also perform the same actions at the command line interface.
You may also install taxonomies by running .altova_taxonomies files downloaded from the Altova website (https://www.altova.com/taxonomy-manager).

Regardless of the manner in which taxonomies were installed, all information about installed taxonomies is tracked in a centralized location on your computer, also known as the local cache directory. The local cache directory contains information about Altova packages (except for the actual taxonomy files, which are installed on demand). The local cache directory is at the following path:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>/var/opt/Altova/pkgs</td>
</tr>
<tr>
<td>macOS</td>
<td>/var/Altova/pkgs</td>
</tr>
</tbody>
</table>
The local cache directory gets updated automatically from time to time, so as to propagate the latest state of the online storage to the local computer. More specifically, the cache is updated as follows:

- When you run the XBRL Taxonomy Manager.
- When you run Altova Solvency II XBRL add-in for Excel for the first time in the same calendar day.
- If Altova Solvency II XBRL add-in for Excel is already running, the cache directory gets updated every 24 hours.
- You can also update the local cache from the online storage on demand, by running the update command at the command line interface.

As you install or uninstall taxonomies, the local cache directory gets automatically updated with information about the available and installed taxonomies, as well as the taxonomy files themselves.

The local cache directory is maintained automatically based on the taxonomies you install or uninstall; it should not be altered or deleted manually. If you ever need to reset XBRL Taxonomy Manager to the original "pristine" state, run the reset command of the command line interface, and then run the initialize command. (Alternatively, run the reset command with the -i option.)
4.1 Run Taxonomy Manager

To run the XBRL Taxonomy Manager, do one of the following:

- In the Solvency II ribbon, click Manage Taxonomies.
- Run (double-click) a file with .altova_taxonomies extension downloaded from the Altova website. To open the XBRL Taxonomy Download Center in your browser, select the Solvency II ribbon, and then click Altova on the Web > Taxonomy Download.
- From the Windows Control Panel, right-click the Altova Taxonomy Manager entry and select Change or Uninstall from the context menu.

In addition, the check box Invoke Altova Taxonomy Manager is available on the last page of the installation wizard, after you complete the installation of Altova Solvency II XBRL add-in for Excel.

Command line interface

To run XBRL Taxonomy Manager from a command line interface:

1. Open a command prompt window and change directory to C:\ProgramData\Altova\SharedBetweenVersions.
2. To display help at the command line, run:

   TaxonomyManager.exe --help
4.2 Install a Taxonomy

To install a taxonomy:

1. Run XBRL Taxonomy Manager.
2. Select the check box next to the taxonomies or taxonomy versions you want to install, and click Apply.

Alternatively, if you have downloaded a file with .altova_taxonomies extension from the Altova website (https://www.altova.com/taxonomy-manager), double-click the .altova_taxonomies file to run it. XBRL Taxonomy Manager opens when you run the .altova_taxonomies file.

Note the following:

- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect for all users accounts on the same computer.
- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect in all Altova XBRL-enabled applications installed on the same computer.
- If the current taxonomy has dependencies on other taxonomies, the dependent taxonomies are also installed (or uninstalled, as applicable).

Command line interface

To install a taxonomy, run:

```
TaxonomyManager.exe install FILTER...
```

Where FILTER means one of the following:

1. A taxonomy identifier in the format <name>-<version>, for example: eb-a-2.10, us-gaap-2020.0. To view all the available taxonomy identifiers and versions, run the list command.
2. An .altova_taxonomies file downloaded from the Altova website.

Installing taxonomies on demand

Whenever XBRL taxonomies required by the add-in are missing from your computer, you may be prompted to install taxonomies on demand. For example, a dialog box such as the one below may appear when you run an action that requires loading XBRL taxonomies:
When you click **Yes**, the missing taxonomies will be installed and the local cache directory will be updated to keep track of this information. You can always view all of the previously installed taxonomies by clicking the **Manage Taxonomies** button in the **Solvency II** ribbon.

If you select **No**, the missing taxonomies will not be installed, but you will not be able to use the add-in in this case.
4.3 Apply Patches

Occasionally, XBRL taxonomies may receive patches from their issuers. When the XBRL Taxonomy Manager detects that patches are available, the following happens:

- If you use XBRL Taxonomy Manager through the Windows graphical user interface, the respective XBRL taxonomies are shown with the icon.
- If you use the command line or a Linux/macOS system, any XBRL taxonomies that have patches are listed when you run the executable with the list -u command.

To apply a patch on Windows:

1. Click the Patch Selection button. The icon of each XBRL taxonomy that qualifies changes from to , and the dialog box informs you about the patches that are to be applied, for example:
Note: The Patch Selection button is enabled only when there are patches available for any of the currently installed XBRL taxonomies.

2. Click Apply.

To apply a patch at the command line interface:

1. Run the list -u command. This lists any taxonomies where patch upgrades are available.
2. Run the upgrade command to install the patches.

For more information, see the reference to the Command Line Interface.
4.4 View Installed Taxonomies

To view all installed taxonomies from a graphical user interface, run XBRL Taxonomy Manager. A selected check box next to a taxonomy (or a taxonomy version) indicates that that taxonomy is installed.

Command line interface
To view all available taxonomies from a command line interface, run:

```
TaxonomyManager.exe list
```

To view only installed taxonomies, run:

```
TaxonomyManager.exe list -i
```

To view only taxonomies where a newer version is available, run:

```
TaxonomyManager.exe list -u
```
4.5 Uninstall a Taxonomy

To uninstall a taxonomy:

1. Run XBRL Taxonomy Manager.
2. Clear the check box next to the taxonomies or taxonomy versions you want to uninstall. If the selected taxonomy is dependent on other taxonomy packages, a dialog box opens, informing you that the dependencies will be removed as well, for example:

   ![Package Dependencies](image)

3. Click Apply to remove the taxonomy and its dependencies.

Note the following:

- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect for all users accounts on the same computer.
- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect in all Altova XBRL-enabled applications installed on the same computer.
- If the current taxonomy has dependencies on other taxonomies, the dependent taxonomies are also installed (or uninstalled, as applicable).

Command line interface

To uninstall a taxonomy, run:

```
TaxonomyManager.exe uninstall FILTER...
```

Where FILTER means one of the following:

1. A taxonomy identifier in the format `<name>-<version>`, for example: `eba-2.10`, `us-gaap-2020.0`. To view all the available taxonomy identifiers and versions, run the list command.
2. An `.altova_taxonomies` file downloaded from the Altova website.
4.6 Command Line Interface

To call XBRL Taxonomy Manager at the command line, you need to know the path of the executable. By default, the XBRL Taxonomy Manager executable is installed at the following path:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux*</td>
<td>/opt/Altova/&lt;%APPNAME-UL%&gt;2021/bin/taxonomymanager</td>
</tr>
<tr>
<td>macOS*</td>
<td>/usr/local/Altova/&lt;%APPNAME-UL%&gt;2021/bin/taxonomymanager</td>
</tr>
<tr>
<td>Windows</td>
<td>C:\ProgramData\Altova\SharedBetweenVersions\TaxonomyManager.exe</td>
</tr>
</tbody>
</table>

* The Linux and macOS paths are applicable only if you are running XBRL Taxonomy Manager on those operating systems in conjunction with Altova cross-platform server applications such as MapForce Server, StyleVision Server, or RaptorXML+XBRL Server.

By convention, this documentation omits the full path of the executable when describing a given command, and uses `<exec>` instead of the executable name, for example:

```<exec> help```

Where `<exec>` is the path or name of the executable.

Calling XBRL Taxonomy Manager from the installation directory

To call the executable without having to type the full path, change the current directory to the one below:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>cd /opt/Altova/&lt;%APPNAME-UL%&gt;2021/bin</td>
</tr>
<tr>
<td>macOS</td>
<td>cd /usr/local/Altova/&lt;%APPNAME-UL%&gt;2021/bin</td>
</tr>
<tr>
<td>Windows</td>
<td>cd &quot;C:\ProgramData\Altova\SharedBetweenVersions&quot;</td>
</tr>
</tbody>
</table>

You can now run a command by calling the executable with a relative path, for example:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux</td>
<td>sudo ./taxonomymanager help</td>
</tr>
<tr>
<td>macOS</td>
<td>sudo ./taxonomymanager help</td>
</tr>
<tr>
<td>Windows</td>
<td>TaxonomyManager.exe help</td>
</tr>
</tbody>
</table>

**Note:** On Linux and macOS systems, the prefix `.//` indicates that the executable is in the current directory. The prefix `sudo` indicates that the command must be run with root privileges.

Calling XBRL Taxonomy Manager from any directory

To call the executable from any directory, refer to it using the absolute path. Alternatively, if you want to call the program by typing just the executable name, you can edit the PATH environment variable of your operating
system so that it includes the full path to the executable's directory. For ways to change the PATH environment variable, refer to the documentation of your operating system.

Notes:

- After changing the PATH environment variable, you may need to close the terminal window and open a new one, in order for the changes to take effect.
- On Linux and macOS, using `sudo` does not take into account the user's PATH.

**Command line syntax**

The general syntax for using the command line is as follows:

```plaintext
<exec> -h | --help | --version | <command> [options] [arguments]
```

In the listing above, the vertical bar `|` separates a set of mutually exclusive items. The square brackets `[]` indicate optional items. Essentially, you can type the executable path followed by either `--h`, `--help`, or `--version` options, or by a command. Each command may have options and arguments. The list of commands is described in the following sections.

### 4.6.1 help

This command provides contextual help about commands pertaining to XBRL Taxonomy Manager executable.

**Syntax**

```plaintext
<exec> help [command]
```

Where `[command]` is an optional argument which specifies any valid command name.

**Remarks**

You can also invoke help by typing a command followed by `-h` or `--help`, for example:

```plaintext
<exec> list -h
```

You can also invoke general help by typing `-h` or `--help` directly after the executable, for example:

```plaintext
<exec> --help
```

**Example**

The following command displays help about the `list` command:

```
Linux, macOS ./taxonomymanager help list
```
4.6.2 initialize

This command initializes XBRL Taxonomy Manager environment. It creates a cache directory where information about all taxonomies is stored. Initialization is performed automatically the first time when you install an Altova application that includes supports for XBRL Taxonomy Manager, so you don't need to run this command under normal circumstances. You typically need to run this command after executing the reset command.

Syntax
<exec> initialize [options]

The alias of this command is init.

Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--help, --h</td>
<td>Display help about this command at the command line.</td>
</tr>
<tr>
<td>--silent, --s</td>
<td>Display only error messages. The default value is false.</td>
</tr>
<tr>
<td>--verbose, --v</td>
<td>Display more information during execution. The default value is false.</td>
</tr>
</tbody>
</table>

4.6.3 install

This command installs one or more taxonomies. Note the following:

- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect for all users accounts on the same computer.
- Installing or uninstalling a taxonomy from XBRL Taxonomy Manager takes effect in all Altova XBRL-enabled applications installed on the same computer.
- If the current taxonomy has dependencies on other taxonomies, the dependent taxonomies are also installed (or uninstalled, as applicable).

Syntax
<exec> install [options] FILTER...

To specify multiple taxonomies to install, repeat FILTER as many times as necessary.

Arguments

<table>
<thead>
<tr>
<th>FILTER</th>
<th>Where FILTER means one of the following:</th>
</tr>
</thead>
</table>
1. A taxonomy identifier in the format `<name>-<version>`, for example: `eba-2.10, us-gaap-2020.0`. To view all the available taxonomy identifiers and versions, run the `list` command.

2. An `.altova_taxonomies` file downloaded from the Altova website.

You can also use abbreviated identifiers if they are unique, for example, `eba`. If you use an abbreviated identifier, this will install the latest available version of that taxonomy.

### Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--help, --h</code></td>
<td>Display help about this command at the command line.</td>
</tr>
<tr>
<td><code>--silent, --s</code></td>
<td>Display only error messages. The default value is <code>false</code>.</td>
</tr>
<tr>
<td><code>--verbose, --v</code></td>
<td>Display more information during execution. The default value is <code>false</code>.</td>
</tr>
</tbody>
</table>

### Example

The following command installs the latest `eba` (European Banking Authority) and `us-gaap` (US Generally Accepted Accounting Principles) taxonomies:

- **Linux, macOS**
  ```bash```
  ```
  ./taxonomymanager install eba us-gaap
  ```

- **Windows**
  ```bash```
  ```
  TaxonomyManager.exe install eba us-gaap
  ```

### 4.6.4 list

Use this command to list taxonomies at the command line, in one of the following ways:

- list all available taxonomies
- list specific taxonomies
- list only installed taxonomies
- list only taxonomies that require upgrade.

#### Syntax

```
<exec> list [options] [FILTER...]
```

This command can be abbreviated with `ls`.

#### Arguments

<table>
<thead>
<tr>
<th>FILTER</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List only taxonomies that contain this string in their name. You can specify this argument multiple times.</td>
<td></td>
</tr>
</tbody>
</table>
Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--help, --h</td>
<td>Display help about this command at the command line.</td>
</tr>
<tr>
<td>--installed, --i</td>
<td>List only installed taxonomies. The default value is false.</td>
</tr>
<tr>
<td>--upgradeable, --u</td>
<td>List only taxonomies where patch upgrades are available. The default value is false.</td>
</tr>
</tbody>
</table>

Examples
To list all available taxonomies, run:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux, macOS</td>
<td>./taxonomymanager list</td>
</tr>
<tr>
<td>Windows</td>
<td>TaxonomyManager.exe list</td>
</tr>
</tbody>
</table>

To list only installed taxonomies, run:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux, macOS</td>
<td>./taxonomymanager list -i</td>
</tr>
<tr>
<td>Windows</td>
<td>TaxonomyManager.exe list -i</td>
</tr>
</tbody>
</table>

To list all taxonomies that contain either "eba" or "us-gaap" in their name, run:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux, macOS</td>
<td>./taxonomymanager list eba us-gaap</td>
</tr>
<tr>
<td>Windows</td>
<td>TaxonomyManager.exe list eba us-gaap</td>
</tr>
</tbody>
</table>

4.6.5 reset

This command removes all installed taxonomies and the cache directory.

**Warning:** This command deletes all installed taxonomies and their information.

After running this command, make sure to run the initialize command, in order to recreate the cache directory. Alternatively, run the reset command with the -i option.

Note that reset -i restores the original installation of the product, so it's recommended to run the update command as well, after performing a reset. Alternatively, run the reset command with the -i and -u options.

Syntax

```bash
<exec> reset [options]
```
Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--help, --h</td>
<td>Display help about this command at the command line.</td>
</tr>
<tr>
<td>--init, --i</td>
<td>Initialize the XBRL Taxonomy Manager environment after reset. Valid values are true and false. The default value is false.</td>
</tr>
<tr>
<td>--silent, --s</td>
<td>Display only error messages. The default value is false.</td>
</tr>
<tr>
<td>--update, --u</td>
<td>Initialize and update the XBRL Taxonomy Manager environment after reset. Valid values are true and false. The default value is false.</td>
</tr>
<tr>
<td>--verbose, --v</td>
<td>Display additional information during execution. The default value is false.</td>
</tr>
</tbody>
</table>

Examples

To reset the XBRL Taxonomy Manager, run:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux, macOS</td>
<td>./taxonomymanager reset</td>
</tr>
<tr>
<td>Windows</td>
<td>TaxonomyManager.exe reset</td>
</tr>
</tbody>
</table>

4.6.6 setdeflang

This command sets the language of XBRL Taxonomy Manager.

Syntax

<exec> setdeflang language

Where language is a mandatory argument supplying the language code. The alias of this command is sdl.

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>The language to be set. Valid values are English (en), French (fr), German (de), Japanese (ja), and Spanish (es).</td>
</tr>
</tbody>
</table>

Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--help, --h</td>
<td>Display help about this command at the command line.</td>
</tr>
</tbody>
</table>

Examples

To set the language to Spanish, run:
### 4.6.7 uninstall

This command uninstalls one or more taxonomies. By default, any taxonomies referenced by the current one are uninstalled as well. To uninstall just the current taxonomy and keep the referenced taxonomies, set the option `--k`.

#### Syntax

```
<exec> uninstall FILTER...
```

To specify multiple taxonomies, repeat `FILTER` as many times as necessary.

#### Arguments

<table>
<thead>
<tr>
<th>FILTER</th>
<th>Where <code>FILTER</code> means one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A taxonomy identifier in the format <code>&lt;name&gt;-&lt;version&gt;</code>, for example: <code>eba-2.10, us-gaap-2020.0</code>. To view all the available taxonomy identifiers and versions, run the <code>list</code> command.</td>
<td></td>
</tr>
<tr>
<td>2. An <code>.altova_taxonomies</code> file downloaded from the Altova website.</td>
<td></td>
</tr>
</tbody>
</table>

#### Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--help, --h</code></td>
<td>Display help about this command at the command line.</td>
</tr>
<tr>
<td><code>--keep-references, --k</code></td>
<td>If this option is set, then referenced taxonomies are not uninstalled. The default value is <code>false</code>.</td>
</tr>
<tr>
<td><code>--silent, --s</code></td>
<td>Display only error messages. The default value is <code>false</code>.</td>
</tr>
<tr>
<td><code>--verbose, --v</code></td>
<td>Display additional information during execution. The default value is <code>false</code>.</td>
</tr>
</tbody>
</table>

#### Example

The following command uninstalls the `eba-2.10` and `us-gaap-2020.0` taxonomies and their dependencies:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux, macOS</td>
<td><code>.taxonomymanager uninstall eba-2.10 us-gaap-2020.0</code></td>
</tr>
<tr>
<td>Windows</td>
<td><code>TaxonomyManager.exe uninstall eba-2.10 us-gaap-2020.0</code></td>
</tr>
</tbody>
</table>
4.6.8 update

This command queries the list of taxonomies available from the online storage and updates the local cache directory. The update of this information takes place implicitly and you shouldn't need to run this command unless you have performed a reset and initialize.

Syntax

<exec> update [options]

Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--help, --h</td>
<td>Display help about this command at the command line.</td>
</tr>
<tr>
<td>--silent, --s</td>
<td>Display only error messages. The default value is false.</td>
</tr>
</tbody>
</table>
| --verbose, --v | Display additional information during execution. The default value is false.

Example

The following command updates the taxonomies information explicitly.

| Linux, macOS   | ./taxonomymanager update                                                    |
| Windows        | TaxonomyManager.exe update                                                  |

4.6.9 upgrade

This command upgrades all eligible taxonomies to the latest available patch version. In other words, it performs only upgrades at patch level of a specific release. Running this command is meaningful only if there are upgradeable taxonomies available. You can identify upgradeable taxonomies by running the list -u command.

Note: The upgrade command would remove a deprecated taxonomy if no newer version is available.

Syntax

<exec> upgrade [options]

Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--help, --h</td>
<td>Display help about this command at the command line.</td>
</tr>
<tr>
<td>--silent, --s</td>
<td>Display only error messages. The default value is false.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>--verbose, --v</code></td>
<td>Display additional information during execution. The default value is false.</td>
</tr>
</tbody>
</table>
5 Command Reference

The add-in commands available in the Solvency II tab of the Excel ribbon are listed below.

Insert New Report
Creates a new Solvency II filing report. For more information, see Creating a New Report. This command is disabled if the report sheet has already been inserted into the workbook.

Import from XBRL
Imports an XBRL instance file into the current Excel spreadsheet (see Importing Data from XBRL). This command is disabled if the report has already been inserted into the workbook. To enable the command, save and close the current report (workbook), and create a new workbook.

Export to XBRL
Exports data from all currently active sheets to an XBRL instance file (see Exporting Data to XBRL).

Validate
Validates report data against the underlying XBRL taxonomy and displays the validation results in a dialog box (see Validating Data).

Toggle Solvency II Report Pane
Toggles the Solvency II Report Pane on or off. By default, this pane is visible.

Toggle Validation Report
Shows or hides the Validation Report window. See Validating Data.

Add Sheet (z-Axis)
Adds a new sheet which allows entering data in a third dimension. This button is enabled only if the table supports a third dimension according to the XBRL taxonomy. For more information, see Entering Data into Three-Dimensional Tables (Z-Axis).

Remove Sheet (z-Axis)
Removes the previously added z-axis sheet.

Add Row
Adds a new row to the currently selected table. This button is enabled only if the table supports growing vertically.

Delete Row
Deletes an existing row. This button is enabled only if the table supports growing vertically.
Add Column
Adds a new column to the currently selected table. This button is enabled only if the table supports growing horizontally.

Delete Column
Removes an existing column. This button is enabled only if the table supports growing horizontally.

Manage Taxonomies
This command opens the XBRL Taxonomy Manager tool, which allows viewing, installing, and uninstalling XBRL taxonomies. See Managing XBRL Taxonomies.

Settings
Displays a dialog box where you can view or change the add-in settings.

Help
Opens this help file in CHM (Microsoft Compiled HTML Help) format.

Add-In Activation
Displays the activation status of the add-in or provides options to enter or purchase a license key code.

About Solvency II Add-In
Displays version information about the add-in.

Altova on the Web
Provides links to the Altova website, including Online Support Center, XBRL Taxonomy Download Center, training and tutorials.
6 Settings

To view or change the add-in settings:

1. In the Excel ribbon, click the Solvency II tab.
2. Click Settings.

The settings you can configure are listed below.

### Instance Creation

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add 'generated by' comment</td>
<td>Specifies if the exported XBRL instances should contain a &quot;Generated by...&quot; comment. Set this option to false if your reporting authority does not allow comments in the created reports. The default value is true.</td>
</tr>
<tr>
<td>Create streamable XBRL</td>
<td>Specifies if the exported XBRL instances should be streamable and contain the xbrl-streamable-instance processing instruction. Set this option to false if your reporting authority does not allow processing instructions in the created reports. The default value is true.</td>
</tr>
<tr>
<td>Treat invalid cell values as</td>
<td>Specifies whether invalid cell values should be treated as validation errors or warnings. The default value is Error.</td>
</tr>
<tr>
<td>Treat missing Identifier as</td>
<td>After you create a new report, the Solvency II Report Pane contains a property called Identifier which is by default empty. This option specifies whether an empty Identifier property should trigger a validation error or a warning. The</td>
</tr>
</tbody>
</table>
### Misc

| Preferred Label Language | Specifies the preferred language to be used in the headers of created worksheets. Note that the respective label resources must be defined in the taxonomy for this setting to take effect. The default value is `en`. |

### Validation

| EIOPA XBRL Filing Rules | Specifies if the additional EIOPA XBRL filing rules (as specified by the "EIOPA XBRL Filing Rules" document) should be checked. The default value is `Enabled`. |
7 License Information

This section contains information about:

- the distribution of this software product
- software activation and license metering
- the license agreement governing the use of this product

Please read this information carefully. It is binding upon you since you agreed to these terms when you installed this software product.

To view the terms of any Altova license, go to the Altova Legal Information page at the Altova website.
